CAPITAL ADEQUACY RATIO OF AN AUTHORIZED INSTITUTION INCORPORATED IN HONG KONG

*COMBINED / CONSOLIDATED RETURN

As at _____

* Delete which is not appropriate. Combined and consolidated returns are defined in the completion instructions.

Name of Authorized Institution	Date of Submission
--------------------------------	--------------------

The Banking Ordinance

Information requested in this return is required under section 63(2) of the Banking Ordinance. The return should be submitted to the Monetary Authority not later than 1 month after the end of each period, unless otherwise advised by the Monetary Authority.

Note: This return is to be prepared in accordance with the completion instructions issued by the Monetary Authority

We certify that:

1. This return is, to the best of our knowledge and belief, correct.
2. The capital adequacy ratio, was at any time not less than that specified under section 3A or 3B of the Banking (Capital) Rules or, if applicable, as specified by the Monetary Authority in a notice served on the institution under section 97F(1) of the Banking Ordinance.

Chief Accountant

Part I: Summary Certificate on Capital Adequacy Ratios
Division A: Calculation of Capital Adequacy Ratios

Item	Nature of item	Reference	Column 1 HK\$'000	Column 2 HK\$'000	Column 3 HK\$'000	
1.	Capital Base	Part II				
1.1	Tier 1 Capital					(A)
1.1(i)	Common Equity Tier 1 Capital					(B)
1.1(ii)	Additional Tier 1 Capital					
1.2	Tier 2 Capital					
1.3	Total Capital					(C)
2.	Calculation of Total Risk-weighted Amount					
2.1	Risk-weighted amount for credit risk (BSC Approach)	Part IIIa				
2.2	Risk-weighted amount for credit risk (STC Approach)	Part IIIb				
2.3	Risk-weighted amount for credit risk (IRB Approach)	Part IIIc				
2.4	Risk-weighted amount for credit risk (CCP)	Part IIIe				
2.5	Risk-weighted amount for credit risk (CVA) (only for Als <u>not</u> using IRB approach)	Part IIIf				
2.6	Risk-weighted amount for credit risk for securitization exposures under:					
(i)	SEC-IRBA [Item 2.6(i) = Part IIId: Item A5(a)]	Part IIId				
(ii)	SEC-ERBA, SEC-SA and SEC-FBA [Item 2.6(ii) = Part IIId: Item A5(b) + Item A6]	Part IIId				
2.7	Total risk-weighted amount for credit risk [Item 2.7 = Item 2.1 + Item 2.2 + Item 2.3 + Item 2.4 + Item 2.5 + Item 2.6(i) + Item 2.6(ii)]					
2.8	Risk-weighted amount for market risk	Part IV				
2.9	Risk-weighted amount for operational risk	Part V				
2.10	Additional risk-weighted amount due to application of capital floor (only for Als using IRB Approach)	Division B				
2.11	Total risk-weighted amount before deductions [Item 2.11 = Item 2.7 + Item 2.8 + Item 2.9 + Item 2.10]					
2.12	Deductions:					
(i)	Portion of regulatory reserve for general banking risks and collective provisions which is not included in Tier 2 Capital (only for exposures that are risk-weighted under BSC approach, STC approach, SEC-IRBA, SEC-SA and SEC-FBA)					
(ii)	Portion of cumulative fair value gains arising from the revaluation of land and buildings which is not included in Tier 2 Capital					
(iii)	Total deductions (i) + (ii)					
2.13	Total risk-weighted amount [Item 2.13 = Item 2.11 - Item 2.12(iii)]					(D)
3.	Calculation of Common Equity Tier 1 Capital Ratio [(B) / (D)] x 100% =					%
4.	Calculation of Tier 1 Capital Ratio [(A) / (D)] x 100% =					%
5.	Calculation of Total Capital Ratio [(C) / (D)] x 100% =					%
6.	IRB coverage (only for Als using IRB Approach) [(Item 2.3 + Item 2.6(i)) / (Item 2.7 - Item 2.4)] x 100%					%

Division B: Calculation of Capital Floor
(Only for authorized institutions using IRB Approach)

Is the authorized institution subject to capital floor? (If yes, proceed to the table below; if no, go directly to Part I Division C)

- / Yes / No

Item	Nature of item	Reference	Column 1 HK\$'000	Column 2 HK\$'000
1. Calculation of capital charge for the application of capital floor				
(i)	Risk-weighted amount for credit risk			
(a)	under BSC Approach <i>(where applicable)</i>	Part IIIa		
(b)	under STC Approach <i>(where applicable)</i>	Part IIIb		
(c)	under SEC-ERBA, SEC-SA and SEC-FBA <i>(where applicable)</i>	Part III d		
(d)	under Division 4 of Part 6A - CCP exposures <i>(where applicable)</i>	Part IIIe		
(e)	under Division 3 of Part 6A - CVA <i>(where applicable)</i>	Part III f		
(ii)	Risk-weighted amount for market risk	Part IV		
(iii)	Risk-weighted amount for operational risk	Part V		
(iv)	Total risk-weighted amount [Item 1(iv) = Item 1(i) + Item 1(ii) + Item 1(iii)]			
(v)	8% of total risk-weighted amount [Item 1(v) = Item 1(iv) x 8%]			
(vi)	Plus: Deductions from Common Equity Tier 1 Capital, Additional Tier 1 Capital and Tier 2 Capital	Part II		
(vii)	Less: Portion of regulatory reserve for general banking risks and collective provisions included in Tier 2 Capital	Part II		
(viii)	Adjusted capital charge before applying capital floor adjustment factor [Item 1(viii) = Item 1(v) + Item 1(vi) - Item 1(vii)]			
(ix)	Capital floor adjustment factor [Please specify: %]			%
(x)	Adjusted capital charge after applying capital floor adjustment factor [Item 1(x) = Item 1(viii) x Item 1(ix)]			
2. Calculation of capital charge under the various approaches in use				
(i)	Risk-weighted amount for credit risk			
(a)	under BSC Approach <i>(where applicable)</i>	Part IIIa		
(b)	under STC Approach <i>(where applicable)</i>	Part IIIb		
(c)	under IRB Approach	Part IIIc		
(d)	under SEC-ERBA, SEC-SA and SEC-FBA <i>(where applicable)</i>	Part III d		
(e)	under SEC-IRBA	Part III d		
(f)	under Division 4 of Part 6A - CCP exposures <i>(where applicable)</i>	Part IIIe		
(ii)	Risk-weighted amount for market risk	Part IV		
(iii)	Risk-weighted amount for operational risk	Part V		
(iv)	Total risk-weighted amount [Item 2(iv) = Item 2(i) + Item 2(ii) + Item 2(iii)]			
(v)	8% of total risk-weighted amount [Item 2(iv) x 8%]			
(vi)	Plus: Deductions from Common Equity Tier 1 Capital, Additional Tier 1 Capital and Tier 2 Capital	Part II		
(vii)	Less: Portion of regulatory reserve for general banking risks and collective provisions included in Tier 2 Capital	Part II		
(viii)	Less: Surplus provisions derived from EL-EP calculation under the IRB approach and the portion of its total regulatory reserve for general banking risks and collective provisions relevant to the SEC-IRBA approach	Part II		
(ix)	Adjusted capital charge [Item 2(ix) = Item 2(v) + Item 2(vi) - Item 2(vii) - Item 2(viii)]			
3.	Difference in adjusted capital charge [Item 3 = Item 1(x) - Item 2(ix)]			
4.	Additional risk-weighted amount due to application of capital floor [Item 4 = max(0, Item 3) x 12.5]			

Division C: Capital Buffer Requirements

Item	Nature of item	Column 1
1.	Net CET1 capital ratio	%
2	Buffer level [Item 2 = Item 2.1 + Item 2.2 + Item 2.3]	%
	<i>of which:</i>	
2.1	Capital conservation buffer ratio	%
2.2	Countercyclical capital buffer ratio	%
2.3	Higher loss absorbency ratio (applicable if the institution is a G-SIB or a D-SIB)	%

Part II: Capital Base

Item	Nature of item	Column 1 HK\$'000	Column 2 HK\$'000
Category I - Common Equity Tier 1 ("CET1") Capital			
(a)	CET1 capital instruments		
(b)	Share premium arising from item (a)		
(c)	Retained earnings		
(i)	of which: unaudited profit or loss of the current financial year and profit or loss of the immediately preceding financial year pending audit completion		
(d)	Disclosed reserves		
(i)	of which: fair value through other comprehensive income - financial assets		
(e)	Minority interests arising from CET1 capital instruments issued by the consolidated bank subsidiaries and held by third parties		
CET1 CAPITAL BEFORE DEDUCTIONS (A)			
(f)	Deduct:		
(i)	Cumulative cash flow hedge reserves that relate to the hedging of financial instruments that are not fair valued on the balance sheet		
(ii)	Cumulative fair value gains or losses on liabilities of the institution that are fair-valued and result from changes in the own credit risk (excluding any debt valuation adjustments referred to in item (xii))		
(iii)	Cumulative fair value gains arising from the revaluation of land and buildings (covering both own-use and investment properties)		
(iv)	Regulatory reserve for general banking risks		
(v)	Goodwill (net of related deferred tax liability)		
(vi)	Other intangible assets (net of related deferred tax liability)		
(1)	of which: Mortgage servicing rights		
(vii)	Defined benefit pension fund assets (net of related deferred tax liability)		
(viii)	Deferred tax assets in excess of deferred tax liabilities		
(ix)	Credit-enhancing interest-only strip, and any gain-on-sale and other increase in the CET1 capital arising from securitization transactions		
(x)	Securitization exposures specified in a notice given by the MA		
(xi)	Valuation adjustments		
(xii)	Debit valuation adjustments in respect of derivative contracts		
(xiii)	Excess of total EL amount over total eligible provisions under the IRB Approach		
(xiv)	Cumulative losses below depreciated cost arising from the institution's holdings of land and buildings		
(xv)	Capital shortfall of regulated non-bank subsidiaries		
(xvi)	Investments in own CET1 capital instruments		
(xvii)	Reciprocal cross holdings in CET1 capital instruments issued by any financial sector entities		

Item	Nature of item	Column 1 HK\$'000	Column 2 HK\$'000
(xviii)	Capital investment in a connected company which is a commercial entity (amount of the net book value of such investment in excess of 15% of the institution's capital base)		
(1)	of which: any amount of loans, facilities or other credit exposures that is required by section 46(1) of BCR to be aggregated with item (f)(xviii)		
(xix)	Insignificant capital investments in CET1 capital instruments issued by financial sector entities that are <u>not</u> subject to consolidation under a section 3C requirement		
(1)	of which: any amount of loans, facilities or other credit exposures that is required by section 46(2) of BCR to be aggregated with item (f)(xix)		
(xx)	Significant capital investments in CET1 capital instruments issued by financial sector entities that are <u>not</u> subject to consolidation under a section 3C requirement		
(1)	of which: any amount of loans, facilities or other credit exposures that is required by section 46(2) of BCR to be aggregated with item (f)(xx)		
For completion of return on a solo / solo-consolidated basis:			
(xxi)	Direct holdings of CET1 capital instruments issued by financial sector entities that are members of the institution's consolidation group		
(1)	of which: any loans, facilities or other credit exposures that is required by section 46(2) of BCR to be aggregated with item (f)(xxi)		
(xxii)	Regulatory deductions applied to CET1 capital due to insufficient Additional Tier 1 capital to cover the required deductions		
CET1 CAPITAL AFTER DEDUCTIONS (B)			
Category II - Additional Tier 1 capital			
(g)	Additional Tier 1 capital instruments issued and share premium, if any		
(i)	of which: amount that is subject to phase out		
(h)	Applicable amount of capital instruments issued by the consolidated bank subsidiaries and held by third parties		
ADDITIONAL TIER 1 CAPITAL BEFORE DEDUCTIONS (C)			
(i)	Deduct:		
(i)	Investments in own Additional Tier 1 capital instruments		
(ii)	Reciprocal cross holdings in Additional Tier 1 capital instruments issued by financial sector entities		
(iii)	Insignificant capital investments in Additional Tier 1 capital instruments issued by financial sector entities that are <u>not</u> subject to consolidation under a section 3C requirement		
(iv)	Significant capital investments in Additional Tier 1 capital instruments issued by financial sector entities that are <u>not</u> subject to consolidation under a section 3C requirement		
For completion of return on a solo / solo-consolidated basis:			
(v)	Direct holdings of Additional Tier 1 capital instruments issued by financial sector entities that are members of the institution's consolidation group		
(vi)	Regulatory deductions applied to Additional Tier 1 capital due to insufficient Tier 2 capital to cover the required deductions		
ADDITIONAL TIER 1 CAPITAL AFTER DEDUCTIONS (D)			
TIER 1 CAPITAL AFTER DEDUCTIONS (B) + (D) = (E)			

Item	Nature of item	Column 1 HK\$'000	Column 2 HK\$'000
Category III - Tier 2 capital			
(j)	Tier 2 capital instruments issued and share premium, if any		
(i)	of which: amount that is subject to phase out		
(k)	Applicable amount of capital instruments issued by the consolidated bank subsidiaries and held by third parties		
(l)	Reserves attributable to fair value gains on revaluation of holdings of land and buildings		
(m)	Regulatory reserve for general banking risks (For the portion apportioned to BSC approach or STC approach, and SEC-ERBA, SEC-SA and SEC-FBA)		
(n)	Collective provisions (For the portion apportioned to BSC approach or STC approach, and SEC-ERBA, SEC-SA and SEC-FBA)		
(o)	Total of (m) & (n) included in Tier 2 Capital (Limited to 1.25% of risk-weighted amount for credit risk calculated by using BSC approach or STC approach, and SEC-ERBA, SEC-SA and SEC-FBA)		
(p)	Surplus provisions for exposures calculated by using IRB approach		
(q)	Regulatory reserve for general banking risks and collective provisions apportioned to SEC-IRBA (Limited to 0.6% of risk-weighted amount for credit risk calculated by using SEC-IRBA)		
TIER 2 CAPITAL BEFORE DEDUCTIONS (F)			
(r)	Deduct:		
(i)	Investments in own Tier 2 capital instruments		
(ii)	Reciprocal cross holdings in Tier 2 capital instruments issued by financial sector entities		
(iii)	Insignificant capital investments in Tier 2 capital instruments issued by financial sector entities that are <u>not</u> subject to consolidation under a section 3C requirement		
(iv)	Significant capital investments in Tier 2 capital instruments issued by financial sector entities that are <u>not</u> subject to consolidation under a section 3C requirement		
For completion of return on a solo / solo-consolidated basis:			
(v)	Direct holdings of Tier 2 capital instruments issued by financial sector entities that are members of the institution's consolidation group		
TIER 2 CAPITAL AFTER DEDUCTIONS (G)			
CAPITAL BASE (E) + (G) = (H)			

Part IIIa: Risk-weighted Amount for Credit Risk (BSC Approach)

Division A: Risk-weighted Amount (On-balance Sheet)

Item	Nature of item	Principal Amount HK\$'000	x Risk-weight %	Risk-weighted = Amount HK\$'000
Class I	Sovereign Exposures			
1.	Loans to or guaranteed by the sovereigns of Tier 1 countries		0	0
2.	Holding of fixed rate debt securities with a residual maturity of less than 1 year or floating rate debt securities of any maturity issued by the sovereigns of Tier 1 countries		10	
3.	Holding of fixed rate debt securities with a residual maturity of not less than 1 year issued by the sovereigns of Tier 1 countries		20	
4.	Holding of fixed rate debt securities with a residual maturity of less than 1 year or floating rate debt securities of any maturity guaranteed by the sovereigns of Tier 1 countries		10	
5.	Holding of fixed rate debt securities with a residual maturity of not less than 1 year guaranteed by the sovereigns of Tier 1 countries		20	
6.	Loans to or guaranteed by the sovereigns of Tier 2 countries which are domestic currency exposures		0	0
7.	Holding of fixed rate debt securities with a residual maturity of less than 1 year or floating rate debt securities of any maturity issued by the sovereigns of Tier 2 countries, which are domestic currency exposures		10	
8.	Holding of fixed rate debt securities with a residual maturity of not less than 1 year issued by the sovereigns of Tier 2 countries, which are domestic currency exposures		20	
9.	Holding of fixed rate debt securities with a residual maturity of less than 1 year or floating rate debt securities of any maturity where: (i) the securities are guaranteed by the sovereigns of Tier 2 countries and (ii) the securities are domestic currency exposures		10	
10.	Holding of fixed rate debt securities with a residual maturity of not less than 1 year where: (i) the securities are guaranteed by the sovereigns of Tier 2 countries and (ii) the securities are domestic currency exposures		20	
11.	Other exposures to the sovereigns of Tier 2 countries		100	
12.	Exposures to relevant international organizations		0	0
SUBTOTAL				

Item	Nature of item	Principal Amount HK\$'000	x Risk-weight %	Risk-weighted = Amount HK\$'000
Class II Public Sector Entity (PSE) Exposures				
13.	Exposures to PSEs of Tier 1 countries		20	
14.	Exposures to PSEs of Tier 2 countries		100	
SUBTOTAL				
Class III Multilateral Development Bank (MDB) Exposures				
15.	Exposures to MDBs		0	0
SUBTOTAL				0
Class IV Bank Exposures				
16.	Exposures to authorized institutions		20	
17.	Exposures to banks incorporated in Tier 1 countries		20	
18.	Exposures to banks incorporated in Tier 2 countries with a residual maturity of less than 1 year		20	
19.	Exposures to banks incorporated in Tier 2 countries with a residual maturity of not less than 1 year		100	
SUBTOTAL				
Class V Cash Items				
20.	Notes and coins		0	0
21.	Government certificates of indebtedness		0	0
22.	Gold bullion held in own vault or on an allocated basis, to the extent backed by gold liabilities		0	0
23.	Gold bullion held not backed by gold liabilities		100	
24.	Cash items in the course of collection		20	
25.	Positive current exposures from delivery-versus-payment transactions which remain unsettled after the settlement date			
25a.	for up to 4 business days		0	0
25b.	for 5 to 15 business days		100	
25c.	for 16 to 30 business days		625	
25d.	for 31 to 45 business days		937.5	
25e.	for 46 or more business days		1,250	
26.	Exposures collateralized by cash deposits		0	0
SUBTOTAL				

Item	Nature of item	Principal Amount HK\$'000	x Risk-weight %	= Risk-weighted Amount HK\$'000
Class VI Residential Mortgage Loans (RMLs)				
27a.	Eligible RMLs		50	
27b.	RMLs that are risk-weighted according to the standard of an overseas regulatory authority			
27c.	Other RMLs		100	
SUBTOTAL				
Class VII Other Exposures				
28a.	Exposures to corporates or individuals not elsewhere reported		100	
28b.	Investments in equity or other capital instruments issued by financial sector entities (other than those subject to capital deduction or 250% risk-weight)		100	
28c.	Investments in equity of other entities (other than those subject to 1250% risk-weight) and holding of collective investment schemes		100	
28d.	Premises, plant and equipment, other fixed assets for own use, and other interest in land		100	
28e.	Investments in capital instruments issued by financial sector entities (other than those subject to capital deduction)		250	
28f.	Multiple-name credit-linked notes			
28g.	Other on-balance sheet exposures which are not elsewhere reported		100	
28h(1)				
28h(2)				
28h(3)				
28h(4)				
SUBTOTAL				
Class VIII Exposures subject to 1250% risk-weight				
29a.	First loss portion of credit protection		1250	
29b.	Significant exposures to commercial entities		1250	
29c.	Non-DVP transactions remain unsettled for 5 or more business days		1250	
SUBTOTAL				

Division B: Risk-weighted Amount (Off-balance Sheet)

Item	Nature of item	Principal Amount HK\$'000	x Credit Conversion Factor %	= Credit Equivalent Amount HK\$'000	Risk-weighted Amount HK\$'000
1.	Direct credit substitutes		100		
2.	Transaction-related contingencies		50		
3.	Trade-related contingencies		20		
4.	Asset sales with recourse		100		
5.	Forward asset purchases		100		
6.	Partly paid-up shares and securities		100		
7.	Forward forward deposits placed		100		
8.	Note issuance and revolving underwriting facilities		50		
9a.	Commitments that are unconditionally cancellable without prior notice		0	0	0
9b.	Other commitments (CCF at 20%)		20		
9c.	Other commitments (CCF at 50%)		50		
SUBTOTAL					

Default Risk Exposures (Current Exposure Method): Bilateral Trades - Derivative Contracts (including centrally cleared trades that are treated as bilateral trades)

Item	Nature of item					
10.	Exchange rate contracts					
	Residual Maturity	Principal Amount HK\$'000	Current Exposure HK\$'000	Potential Exposure HK\$'000	Credit Equivalent Amount HK\$'000	Risk-weighted Amount HK\$'000
10a.	1 year or less					
10b.	Over 1 year to 5 years					
10c.	Over 5 years					
SUBTOTAL						
11.	Interest rate contracts					
	Residual Maturity	Principal Amount HK\$'000	Current Exposure HK\$'000	Potential Exposure HK\$'000	Credit Equivalent Amount HK\$'000	Risk-weighted Amount HK\$'000
11a.	1 year or less					
11b.	Over 1 year to 5 years					
11c.	Over 5 years					
SUBTOTAL						
12.	Equity contracts					
	Residual Maturity	Principal Amount HK\$'000	Current Exposure HK\$'000	Potential Exposure HK\$'000	Credit Equivalent Amount HK\$'000	Risk-weighted Amount HK\$'000
12a.	1 year or less					
12b.	Over 1 year to 5 years					
12c.	Over 5 years					
SUBTOTAL						
13.	Precious metal contracts					
	Residual Maturity	Principal Amount HK\$'000	Current Exposure HK\$'000	Potential Exposure HK\$'000	Credit Equivalent Amount HK\$'000	Risk-weighted Amount HK\$'000
13a.	1 year or less					
13b.	Over 1 year to 5 years					
13c.	Over 5 years					
SUBTOTAL						

Item	Nature of item					
14.	Debt security contracts or other commodity contracts					
	Residual Maturity	Principal Amount HK\$'000	Current Exposure HK\$'000	Potential Exposure HK\$'000	Credit Equivalent Amount HK\$'000	Risk-weighted Amount HK\$'000
14a.	1 year or less

	(b) Specialized lending (high-volatility commercial real estate)								
	(c) Small-and-medium sized corporates								
	(d) Other corporates								
2.	Sovereign exposures , of which								
	(a) Sovereigns								
	(b) Sovereign foreign public sector entities								
	(c) Multilateral development banks								
3.	Bank exposures , of which								
	(a) Banks								
	(b) Securities firms								
	(c) Public sector entities (excluding sovereign foreign public sector entities)								
4.	Retail exposures , of which								
	(a) Residential mortgages								
	(b) Qualifying revolving retail exposures								
	(c) Small business retail exposures								
	(d) Other retail exposures to individuals								
5.	Total								
6.	Deduction from CET1 capital [Item 6 = Item 5(c) - Item 5(f)]								
7.	Surplus provisions [Item 7 = Item 5(f) - Item 5(c)]								
8.	0.6% of total risk-weighted amount for credit risk (IRB Approach) [Item 8 = Item 8 of Form_IRB_TOTCRWA x 0.6%]								
9.	Surplus provisions added to Tier 2 capital [Min(Item 7, Item 8)]								

Part III d : Risk-weighted Amount for Credit Risk (Securitization Exposures)

Division A : Summary of Risk-weighted Amount and Capital Deductions

(in HK\$'000)

A. Risk-weighted amount	Total amount (1)	Amount incurred as an originating institution (2)
A1. Under SEC-IRBA		
A2. Under SEC-ERBA		
A3. Under SEC-SA		
(a) of which RWA for re-securitization exposures		
A4. Total (item (A1) + item (A2) + item (A3))		
A5. Total after adjusted for maximum capital requirement		
(a) under the SEC-IRBA		
(b) under the SEC-ERBA and SEC-SA		
A6. Under SEC-FBA		
A7. Adjusted total (item (A5) + item (A6))		
of which:		
(a) RWA for off-balance sheet exposures whose CCF is not 100%		
(b) RWA for unrated exposures (e.g. liquidity facilities, servicer cash advance facilities and credit enhancements) extended to ABCP programme		
B. Capital deductions		
B1. Credit-enhancing interest-only strip		
B2. Gain-on-sale		
B3. Other increase in the CET1 capital		
B4. Other exposures specified by the Monetary Authority		

- Notes:
- a. SEC-IRBA means the securitization internal ratings-based approach.
 - b. SEC-ERBA means the securitization external ratings-based approach.
 - c. SEC-SA means the securitization standardized approach.
 - d. SEC-FBA means the securitization fall-back approach.
 - e. Securitization exposures include re-securitization exposures unless otherwise stated.

A.1 Interest rate exposures - specific risk

(b) Securitization exposures that do not fall within a correlation trading portfolio (Note (1))

(HK\$'000)

A. Market risk capital charge calculations

Securitization Exposures	Credit quality grades		Positions incurred as an investing institution		Positions incurred as an originating institution		Market risk capital charge factor for specific risk		Market risk capital charge for specific risk		
	Long-term	Short-term	Long	Short	Long	Short	For investing institutions	For originating institutions	For long positions	For short positions	Applicable amount (Note (2))
	(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)	(11)
2.7 Total (Item 2.7 = sum of (row (m) of items 2.1 to 2.5) + item 2.6)											
(a) Of which securitization (exclude re-securitization) exposures											
(i) rated											
(ii) unrated											
(b) Of which re-securitization exposures											
(i) rated											
(ii) unrated											
2.8 Total market risk capital charge for specific risk (Item 2.8(9) / 2.8(10) = Item 2.7(9) / 2.7(10) multiplied by scaling factor 1.06)											
3. Total											
- Position col. (3) to (6): Item 1.4 + item 2.7											
- Market risk capital charge col. (9) & (10): Item 1.4 + item 2.8											

B. Capital deductions

	Positions incurred as an investing institution	Positions incurred as an originating institution	Total
	(a)	(b)	(c)
1. Gain-on-sale arising from securitization transaction as an originating institution			
2. Other exposures as specified by the Monetary Authority			
3. Total deductions			

Note: (1) Securitization exposures include re-securitization exposures unless otherwise stated.

(2) During the transitional period (securitization) of 1 January 2012 to 31 December 2013, both dates inclusive, the applicable total market risk capital charge for specific risk (i.e. column (11)) for the interest rate exposures of a reporting institution is calculated as the larger of the market risk capital charge for the long positions (i.e. column (9)) or the market risk capital charge for the short positions (i.e. column (10)). Upon the expiry of the transitional period (securitization), the applicable total market risk capital charge for specific risk (i.e. column (11)) of the institution is calculated as the sum of the market risk capital charge for the gross (i.e. long + short) positions (i.e. column (9) + column (10)).

(3) STC(S) approach means the method of calculating credit risk for securitization exposures under the standardized (securitization) approach.

(4) IRB(S) approach means the method of calculating credit risk for securitization exposures under the internal ratings -based (securitization) approach.

(5) "Rated securitization exposures" means exposures with an ECAI issue specific rating under STC(S) approach and IRB(S) approach, or in the absence of an ECAI issue specific rating, an inferred rating under IRB(S) approach.

(6) "Unrated" securitization exposures means securitization exposures other than rated securitization exposures and those treated as if not rated for regulatory capital purposes.

A.1 Interest rate exposures - specific risk

(c) Correlation trading portfolio

Euro	EUR					
Chinese renminbi	CNY					
Canadian dollars	CAD					
Swiss francs	CHF					
Australian dollars	AUD					
Singapore dollars	SGD					
New Zealand dollars	NZD					
Gold	GOL					
Foreign currencies not separately specified above						
Hong Kong dollars	HKD					
Sum of net long / short positions						
USD / HKD position						
Adjusted sum of net long / short positions						

Calculation

1.	Adjusted sum of net long / short positions	
2.	Net position in gold (in absolute value)	
3.	Total net open position (Item 3 = Item 1 + Item 2)	
4.	Market risk capital charge factor	8%
TOTAL MARKET RISK CAPITAL CHARGE FOR FOREIGN EXCHANGE EXPOSURES		

- Note:
- (1) Figures are extracted from Part I columns 5, 7 and 8 (where applicable) of the Return of Foreign Currency Position (MA(BS)6) but reported in HK\$'000, subject to any applicable adjustments specified in paragraphs 6(b), 79 and 80 of the completion instructions.
 - (2) For exchange rate-related option contracts, the delta-weighted positions are reported above or, if the reporting institution engages only in the purchase of option contracts as defined in the completion instructions, such option contracts can be carved out and reported in Division E.1.

Division D: **STM Approach - Commodity Exposures**

(HK\$'000)

Item	Nature of items	Long position	Short position	Net long or short position (in absolute value)	Gross long plus short positions	Market risk capital charge factor		Total market risk capital charge for commodity exposures
						Net position	Gross position	
		(1)	(2)	(3) = (1) - (2)	(4) = (1) + (2)	(5)	(6)	(7) = (3) x (5) + (4) x (6)
1.	Platinum					15%	3%	
2.	Silver					15%	3%	
3.	Other precious metals (excluding gold) _____					15%	3%	
4.	Other precious metals (excluding gold) _____					15%	3%	
5.	Base metals and non-precious metals _____					15%	3%	
6.	Base metals and non-precious metals _____					15%	3%	
7.	Energy _____					15%	3%	
8.	Energy _____					15%	3%	
9.	Agricultural assets _____					15%	3%	
10.	Agricultural assets _____					15%	3%	
TOTAL MARKET RISK CAPITAL CHARGE FOR COMMODITY EXPOSURES								

- Note:
- (1) Where a commodity swap contract involves a leg requiring the receipt or payment of fixed or floating rate interest, that leg should be regarded as an interest rate exposure and reported in Division A.2, with the commodity exposure being included in the particular commodity above.
 - (2) For commodity-related option contracts, the delta-weighted positions should be reported above or, if the reporting institution engages only in the purchase of option contracts as defined in the completion instructions, such option contracts can be carved out and reported in Division E.1.
 - (3) The reporting institution should use separate form(s) for reporting of items 3 to 10 above if the rows of this form are not enough.

Division E: STM Approach - Option Exposures

E.1 Simplified approach *(For reporting institutions which purchase only option contracts as defined in the completion instructions.)*

1(a) Long option contract with a related position in the underlying exposure of the option contract

Report the market risk capital charge for each option contract as well as the related position in the underlying exposure below.

Market risk capital charge = (Fair value of the underlying exposure of the option contract) x (Sum of the market risk capital charge factors for general market risk and specific risk for the underlying exposure) – (The amount by which the option contract is in-the-money)

		Market risk capital charge factor		Long underlying exposure & long put option contract	Short underlying exposure & long call option contract	Total market risk capital charge
Item	Nature of the underlying exposure	Specific risk	General market risk			
1.1	Debt instruments (Note (1))	0.00% (Note(2))	Note (3)			
		0.25% (Note(2))	Note (3)			
		1.00% (Note(2))	Note (3)			
		1.60% (Note(2))	Note (3)			
		8.00% (Note(2))	Note (3)			
		12.00% (Note(2))	Note (3)			
		To be specified (Note(2))	Note (3)			
1.2	Interest rate, i.e. non-debt related (Note (1))	0.00%	Note (3)			
1.3	Equity (Note(1))	8.00%	8.00%			
1.4	Foreign exchange	0.00%	8.00%			
1.5	Commodity	0.00%	15.00%			
TOTAL MARKET RISK CAPITAL CHARGE FOR OPTION EXPOSURES						

Note: (1) Only trading book positions should be reported.

(2) The classes are same as those in Division A.1(a).

(3) The general market risk capital charge should be calculated as per the risk-weights according to the time bands set out in Division A.2.

E.1 Simplified approach *(For reporting institutions which purchase only option contracts as defined in the completion instructions.)*

1(b) Long call or long put option contracts

Report the market risk capital charge for each option contract below. Such market risk capital charge should be the lesser of (i) the fair value of the underlying exposure of the option contract multiplied by the sum of the market risk capital charge factors for general market risk and specific risk for the underlying exposure of the option contract and (ii) the fair value of the option contract.

(HK\$'000)

Item	Nature of the underlying exposure	Market risk capital charge factor		Long put option contract	Long call option contract	Total market risk capital charge
		Specific risk	General market risk			
1.1	Debt instruments (Note (1))	0.00% (Note(2))	Note (3)			
		0.25% (Note(2))	Note (3)			
		1.00% (Note(2))	Note (3)			
		1.60% (Note(2))	Note (3)			
		8.00% (Note(2))	Note (3)			
		12.00% (Note(2))	Note (3)			
		To be specified (Note(2))	Note (3)			
1.2	Interest rate, i.e. non-debt related (Note (1))	0.00%	Note (3)			
1.3	Equity (Note(1))	8.00%	8.00%			
1.4	Foreign exchange	0.00%	8.00%			
1.5	Commodity	0.00%	15.00%			
TOTAL MARKET RISK CAPITAL CHARGE FOR OPTION EXPOSURES						

- Note:
- (1) Only trading book positions should be reported.
 - (2) The classes are same as those in Division A.1(a).
 - (3) The general market risk capital charge should be calculated as per the risk-weights according to the time bands set out in Division A.2.

E.2 Delta-plus approach - gamma and vega risks *(For reporting institutions which use the delta-plus approach to report option contracts)*

2(a) Debt-related and interest rate option contracts

Currency: (separate form for each currency)

(HK\$'000)

Time band		Market risk capital charge for gamma risk (negative gamma impact)	Market risk capital charge for vega risk
Coupon of not less than 3% per annum	Coupon of less than 3% per annum		
≤1 month	≤1 month		
>1 to 3 months	>1 to 3 months		
>3 to 6 months	>3 to 6 months		
>6 to 12 months	>6 to 12 months		
>1 to 2 years	>1.0 to 1.9 years		
>2 to 3 years	>1.9 to 2.8 years		
>3 to 4 years	>2.8 to 3.6 years		
>4 to 5 years	>3.6 to 4.3 years		
>5 to 7 years	>4.3 to 5.7 years		
>7 to 10 years	>5.7 to 7.3 years		
>10 to 15 years	>7.3 to 9.3 years		
>15 to 20 years	>9.3 to 10.6 years		
>20 years	>10.6 to 12 years		
	>12 to 20 years		
	>20 years		
Total 2(a)			

2(b) Equity option contracts

(HK\$'000)

Types of underlying exposure	Market risk capital charge for gamma risk (negative gamma impact)	Market risk capital charge for vega risk
Total 2(b)		

Note: Report the delta-weighted position of option contracts into Divisions A to D as appropriate.

E.2 Delta-plus approach - gamma and vega risks *(For reporting institutions which use the delta-plus approach to report option contracts)*

2(c) Foreign exchange and gold option contracts

(HK\$'000)

Types of underlying exposure	Market risk capital charge for gamma risk (negative gamma impact)	Market risk capital charge for vega risk
Total 2(c)		

2(d) Commodity option contracts

(HK\$'000)

Types of underlying exposure	Market risk capital charge for gamma risk (negative gamma impact)	Market risk capital charge for vega risk
Total 2(d)		

Note: Report the delta-weighted position of option contracts into Divisions A to D as appropriate.

Division F: IMM Approach (Note (1a))

F.1 Market risk capital charge under the IMM approach

(HK\$'000)

ItemNature of items		VaR / Stressed VaR		Number of back-testing exceptions		Multiplication factor for VaR (m _c) / Stressed VaR (m _s) (Note (2))	Total market risk capital charge
		End of quarter VaR / Stressed VaR (Note (2a))	Average VaR / Stressed VaR over last 60 trading days	Based on actual profit & loss	Based on hypothetical profit & loss		
		(a)	(b)	(c)	(d)	(e)	(f)

1.1	Specific risk calculated by internal models (Note (3))						
1.2	Average VaR x multiplication factor m _c (Item 1.2 = Item 1.1 (b) x Item 1.1 (e))						
1.3	Market risk capital charge for specific risk calculated by internal models (Item 1.1(a) or item 1.2, whichever is higher)						
2.	Stressed VaR						
2.1	Specific risk calculated by internal models (Note (3))						
2.2	Average stressed VaR x multiplication factor m _s (Item 2.2 = Item 2.1 (b) x item 2.1 (e))						
2.3	Market risk capital charge for specific risk calculated by internal models (Item 2.1(a) or item 2.2, whichever is higher)						
3.	Total market risk capital charge for specific risk calculated by internal models - VaR and stressed VaR (Item 1.3 + Item 2.3)						

F.1 Market risk capital charge under the IMM approach

(HK\$'000)

(c) Specific risk - Incremental risk charge (IRC), comprehensive risk charge (CRC) and supplemental capital charge (SCC)				
Item	Nature of items	IRC / CRC		Scaling factor for IRC (S _i) / CRC (S _c) (Note (4))
		Latest	Average over last 12 weeks	
		(a)	(b)	(c)
1.	IRC			
1.1	IRC - Interest rate			
1.2	IRC - Equity			
1.3	Aggregate of risk categories			
1.4	Market risk capital charge for specific risk calculated by internal models (Item 1.4 = Item 1.3 (c)(Si) x the higher of (Item 1.3 (a) or Item 1.3 (b))			
2.	CRC - Correlation trading portfolio			
2.1	CRC			
2.2	CRC calculated by internal models (Item 2.1 (c) (Sc) x the higher of (Item 2.1 (a) or Item 2.1 (b))			
2.3.1	Market risk capital charge for specific risk for long positions calculated under the STM approach			
2.3.2	Market risk capital charge for specific risk for short positions calculated under the STM approach			
2.3	Floor for CRC (Item 2.3 = 8% x the higher of (Item 2.3.1 or Item 2.3.2))			
2.4	Market risk capital charge for specific risk (Item 2.4 = the higher of Item 2.2 or Item 2.3)			
3.	Supplemental capital charge arising from the correlation trading portfolio			
4.	Total market risk capital charge for specific risk calculated by internal models - IRC, CRC and SCC (Item 1.4 + item 2.4 + item 3)			

(d)	Total market risk capital charge for specific risk calculated by internal models (Item F.1(b)3 + item F.1(c)4)	
------------	---	--

(e)	TOTAL MARKET RISK CAPITAL CHARGE UNDER THE IMM APPROACH (Item F.1(a)3 + item F.1(d))	
------------	---	--

F.2 Largest daily losses over the quarter

(HK\$'000)

Date (DD/MM/YYYY)	Amount of loss (absolute value)	VaR

- Note: (1a) A reporting institution must use the STM approach to calculate the market risk capital charge for specific risk for the following specific risk interest rate exposures irrespective of the approach it adopts for calculating the VaR and stressed VaR for general market risk and (where applicable) specific risk for those exposures:
- (a) securitization exposures which fall within section 286(a)(ii) of the Banking (Capital) Rules;
 - (b) exposures which fall within section 286(a)(iii) of the Banking (Capital) Rules (i.e. correlation trading portfolio) but for which the institution does not have the approval of the MA to calculate a comprehensive risk charge; and
 - (c) nth-to-default credit derivative contracts which fall within section 286(a)(iv) of the Banking (Capital) Rules.
- (1) For VaR and stressed VaR, the total reported under the individual items is not necessarily equal to the sum of their respective components because of the correlation across the risk categories.
- (2a) If the stressed VaR as at the end of the reporting quarter is not available, reporting institutions should report the latest available stressed VaR in the relevant cells.
- (2) The multiplication factor is the sum of (i) the value of three; (ii) the plus factor based on the number of back-testing exceptions for the last 250 trading days based on the VaR (but not the stressed VaR); and (iii) any additional plus factor assigned to the institution by the MA.
- (3) If a reporting institution uses one internal model to calculate both the market risk capital charge for general market risk and market risk capital charge for specific risk, the institution does not need to report its calculation for general market risk and specific risk separately. The figures reported in Section (a) in respect of general market risk can cover both general market risk and specific risk, and the institution is not required to complete Section (b) in respect of specific risk.
- (4) The scaling factor is 1 or such other value as the MA may specify in a notice in writing given to the institution.

Part V: Risk-weighted Amount for Operational Risk

Completion Instructions

Return of Capital Adequacy Ratio Part I – Summary Certificate on Capital Adequacy Ratios Form MA(BS)3(I)

Introduction

1. Form MA(BS)3(I) is divided into two divisions:
 - (a) Division A – to be completed by all reporting institutions;
 - (b) Division B – to be completed by reporting institutions using the *internal ratings-based approach (IRB approach)*.
2. Division A is for a reporting institution to provide summary information on its quarter-end Common Equity Tier 1 capital ratio, Tier 1 capital ratio and Total capital ratio and the relevant aggregate figures (mainly extracted from other parts of the Return) for computing the ratios. Division B collects information for the determination of the *capital floor* by a reporting institution using the IRB approach. Division C is for a reporting institution to report information relating to capital buffer requirements applicable to it.
3. This return and its completion instructions should be read in conjunction with the Banking (Capital) Rules (BCR) and the relevant supervisory policy/guidance on the revised capital adequacy framework.

Specific Instructions

Division A: Calculation of Capital Adequacy Ratios

4. The figures reported for items 1.1 to 1.3, 2.1 to 2.6(ii), 2.8, and 2.9 should be extracted from other parts of the Return. See Annex I-A for a mapping table on items in this Form and the corresponding items in other Forms.
5. Reporting institutions using the IRB approach, regardless of whether they also use other prescribed approaches to calculate credit risk, are not required to complete item 2.5, since the total *CVA risk-weighted amount* of the institutions reported under Part IIIf has already been incorporated into the institutions' *risk-weighted amount for credit risk* (credit RWA) reported under Part IIIc and reflected under item 2.3.
6. Only reporting institutions using the IRB approach are required to complete item 2.10 and item 6. It should be noted that item 2.10 will only be accessible to **reporting institutions that use the IRB approach, and its value** should be equal to item 4 of Division B. In calculating the IRB coverage ratio under item 6, the credit RWA in respect of the relevant reporting institutions' exposures to central counterparties (CCP) (i.e. item 2.4) are excluded from the denominator.

7. Item 2.12(i) must be completed by the reporting institution if **regulatory reserve for general banking risks** and **collective provisions** have been made for or apportioned to—

(a) its non-securitization exposures that are risk-weighted by using the **basic approach (BSC approach)** or the **standardized (credit risk) approach (STC approach)**; or

(b) its securitization exposures that are risk-weighted by using the **securitization external ratings-based approach (SEC-ERBA)**, **securitization standardized approach (SEC-SA)** and **securitization fall-back approach (SEC-FBA)**.

The institution must report in this item the amount of the above regulatory reserve for general banking risks and collective provisions that exceeds 1.25% of the credit RWA reported under items 2.1, 2.2 and 2.6(ii). To avoid doubts, risk-weighted amount for CCP and CVA, if any, is excluded for the calculation of this 1.25% cap.

8. Item 2.12(ii) refers to the portion of cumulative fair value gains arising from the revaluation of the institution's holdings of land and buildings (except land and buildings mortgaged to the reporting institution to secure a debt) which is not included in Tier 2 Capital. For this purpose, whether such amount should be net or gross of deferred tax liabilities will be based on the prevailing accounting standards applicable within a given jurisdiction.

Division B: Calculation of Capital Floor

9. A reporting institution using the IRB approach (whether foundation or advanced) for capital adequacy purposes is subject to a capital floor for the first three years of the adoption of the IRB approach. The use of the capital floor is to prevent a sudden fall in capital charges solely as a result of the changes in how the credit RWA is measured.

10. A reporting institution migrating from the **foundation IRB approach (FIRB)** to the **advanced IRB approach (AIRB)** will generally not be subject to the capital floor if it has already been subject to a capital floor for a period of three years since its adoption of the FIRB. However, a reporting institution that is migrating to the AIRB during the first three years of using the FIRB will need to continue to adopt the capital floor for the remaining period. For example, a reporting institution moving to the AIRB after using the FIRB for two years should continue to be subject to the capital floor in the third year.

11. The Monetary Authority (MA) may require a reporting institution using the IRB approach to keep the capital floor in place beyond the three-year period or reinstate the capital floor requirement for a reporting institution in the following circumstances-

(i) for so long as the MA is satisfied that the prevailing banking supervisory standards relating to capital issued by the Basel Committee require a capital floor to continue to be applied to entities using the Internal Ratings-Based Approach beyond the first three years of adoption; and

- (ii) where this is deemed appropriate by the MA based on the institution's circumstances (e.g. IRB compliance problems have emerged pending rectification or possible material prudential concerns on the financial soundness of the institution).
12. A reporting institution using the IRB approach should indicate whether it is subject to the capital floor requirement as at the reporting date by answering the filtering question at the top of Division B by inputting either "Yes" or "No"¹. Those institutions which have answered "Yes" should proceed to complete the data table in Division B below the question, while the others should go directly to Part **I – Division C** of the return.

(A) Calculation of capital charge for the application of capital floor

13. Subject to paragraph 18, a reporting institution which is subject to the capital floor should calculate the difference between:
- (i) the floor amount of capital (capital floor) as calculated in accordance with paragraphs 14 to 16 (details to be reported under items 1(i) to (x) of Division B); and
 - (ii) the actual amount of capital as calculated in accordance with paragraph 17 (details to be reported under items 2(i) to (ix) of Division B).

If the floor amount of capital is larger than the actual amount of capital, the institution is required to report the product of such difference and 12.5 in item 4 of Division B and add such amount to the credit RWA (i.e. in item 2.10 of Division A). Otherwise, the figures reported under item 4 of Division B and item 2.10 of Division A should be zero.

14. For a reporting institution that has started to use the IRB approach within the transitional period from 1 January 2007 to 31 December 2009, the capital floor is derived by applying an adjustment factor (see paragraph 16) to the sum of the following amounts:
- (a) 8% of the total RWA² (to be reported under item 1(v)) as calculated:
 - (i) for credit risk under the BSC approach or the STC approach³ (to be reported under item 1(i)(a) or (b), as the case requires);

¹ By virtue of HKMA circular of 20 December 2013 and related notices issued to relevant AIs under section 225(6) of the BCR, all AIs that use the IRB approach are required to be subject to the capital floor requirement on the ground mentioned in paragraph 11(i).

² To facilitate a closer comparison with the capital calculation under the current Accord, a reporting institution adopting the IRB approach within the transitional period is not required to include the RWAs calculated for operational risk for the calculation of the capital floor.

- (ii) for credit risk in respect of securitization exposures under the **SEC-ERBA, SEC-SA and SEC-FBA, whichever is** applicable (to be reported under item 1(i)(c)); and
- (iii) for market risk under the approach in use (i.e. the *standardized (market risk) approach* and/or the *internal models approach*) (to be reported under item 1(ii)).

The total RWA is determined by:

Credit RWA + market risk capital charges x 12.5

- (b) plus all deductions from the Common Equity Tier 1 capital, Additional Tier 1 capital and Tier 2 capital (to be reported under item 1(vi));
 - (c) less the amount of regulatory reserve for general banking risks and collective provisions which is included in the Tier 2 capital (to be reported under item 1(vii)).
15. For a reporting institution that has started, or will start, to use the IRB approach after the transitional period, the calculation of the capital floor is derived by applying an adjustment factor (see paragraph 16) to the sum of the following amounts:
- (a) 8% of the total RWA (to be reported under item 1(v)) as calculated:
 - (i) for credit risk under the STC approach (to be reported under item 1(i)(b));
 - (ii) for credit risk in respect of securitization exposures under the **SEC-ERBA, SEC-SA and SEC-FBA, whichever is** applicable (to be reported under item 1(i)(c));
 - (iii) for credit risk in respect of exposures to CCP in accordance with Division 4 of Part 6A (the amount reported under item 5 of Part IIIe to be reported under item 1(i)(d));
 - (iv) for credit risk in respect of **CVA risk** to counterparties in accordance with Division 3 of Part 6A (the aggregate of the CVA risk-weighted amounts reported under Part IIIf to be reported under item 1(i)(e));
 - (v) for market risk under the approach in use (to be reported under item 1(ii)); and
 - (vi) for operational risk under the approach in use (i.e. the *basic indicator approach*, the *standardized (operational risk) approach* or the *alternative standardized approach*) (to be reported under item 1(iii)).

The total RWA is determined by:

Credit RWA + market risk capital charges x 12.5 + operational risk capital charges x 12.5

³ Subject to the prior consent of the MA, a reporting institution using the STC approach for the calculation of credit RWA before migrating to the IRB approach within the transitional period may use the STC approach as the basis for calculating the capital floor.

- (b) plus all deductions from the Common Equity Tier 1 capital, Additional Tier 1 capital and Tier 2 capital (to be reported under item 1(vi));
- (c) less the amount of regulatory reserve for general banking risks and collective provisions which is included in the Tier 2 capital (to be reported under item 1(vii)).

16. The adjustment factors to be used for the calculation of the floor amount of capital by a reporting institution starting to use the IRB approach within or after the transitional period are set out in the table below, unless the MA has specified another adjustment factor (not exceeding 100%) pursuant to section 225(5)(c) or (6)(c)(i) of the **BCR**.

Date of IRB approach implementation	1 st year of implementation	2 nd year of implementation	3 rd year of implementation
<u>Within</u> transitional period	95%	90%	80%
<u>After</u> transitional period ⁴	90%	80%	70%

The institution is required to fill in the applicable adjustment factor in item 1(ix).

(B) Calculation of capital charge under the various approaches in use

17. In the years in which the capital floor applies, a reporting institution should also calculate the actual amount of capital as follows:
- (a) 8% of total RWA (to be reported under item 2(v)) as determined under the various approaches in use for
 - (i) credit risk, including credit risk in respect of securitization exposures or exposures to central counterparties where applicable (to be reported under items 2(i)(a), (b), (c), (d), (e) or (f), as the case requires);
 - (ii) market risk (to be reported under item 2(ii)); and
 - (iii) operational risk (to be reported under item 2(iii)).

The total RWA is determined by:

Credit RWA + market risk capital charges x 12.5 + operational risk capital charges x 12.5

- (b) plus all deductions from the Common Equity Tier 1 capital, Additional Tier 1 capital and Tier 2 capital (to be reported under item 2(vi)), including the shortfall amount (i.e. **total EL amount > total eligible provisions**) derived from EL-EP calculation (See Section C of the Completion Instructions for MA(BS)3(IIIc));

⁴ Lower adjustment factors are used to take account of the inclusion of operational risk capital charges for the calculation of capital floor after the transitional period (see also footnote 2).

- (c) less the amount of regulatory reserve for general banking risks and collective provisions included in the Tier 2 capital (to be reported under item 2(vii)) if the institution uses the BSC approach, the STC approach, the SEC-ERBA, SEC-SA and/or SEC-FBA for any portion of its credit exposures;
- (d) less the surplus amount of provisions under the IRB approach (i.e. where total eligible provisions > total EL amount) included in the Tier 2 capital derived from EL-EP calculation; and the portion of total regulatory reserve for general banking risks and collective provisions relevant to the securitization internal ratings-based approach (SEC-IRBA) that is included in the Tier 2 capital (to be reported under item 2(viii)).

(C) Adjustments to the calculation methods of capital floors

18. Where the MA extends or reapplies the capital floor requirement to a reporting institution using the IRB approach in the circumstance stated in paragraph 11(i), the MA may specify in a notice to the institution –
- (i) an adjustment factor (not exceeding 100%) for the purposes of calculating the floor amount of capital; and
 - (ii) any other adjustments to the method of calculating the floor amount of capital and the actual amount of capital,

which is considered reasonable by the MA to ensure that the capital floor is calculated substantially in accordance with the relevant prevailing banking supervisory standards relating to capital issued by the Basel Committee.

Division C: Capital Buffer Requirements

19. A reporting institution is required to observe the following in reporting under this Division:

Item		Reporting
1.	Net CET1 capital ratio ⁵	Report the ratio, expressed as a percentage, of (a) the amount of the institution's CET1 capital less the amount of CET1 capital that the institution requires for complying with the minimum CET1 capital ratio, Tier 1 capital ratio and Total capital ratio applicable to it as set out in section 3B of the BCR and as varied by the MA under section 97F of the Banking Ordinance, to (b) the sum of the institution's risk-weighted amount for credit risk, risk-weighted amount for market risk and risk-weighted amount for operational risk, as determined in

⁵ Reporting reflects calculation requirement under section 3E(2) of the BCR.

Item		Reporting
		<p>accordance with the BCR (i.e. the Total risk-weighted amount as reported under item 2.13 in Division A).</p> <p>Please refer to the illustrative examples in Annex I-B on how to calculate the net CET1 capital ratio.</p>
2.	Buffer level	<p>Report the buffer level that is applicable to an institution, expressed as a percentage and calculated according to section 3G of the BCR –</p> <p>(a) if the institution is a G-SIB or a D-SIB – Item 2.1 + 2.2 + 2.3 in this Division; or</p> <p>(b) in any other cases – Item 2.1 + 2.2 in this Division.</p>
2.1	Capital conservation buffer ratio (CB ratio)	Report the CB ratio for calculating an institution's buffer level under section 3G of the BCR as at the reporting date.
2.2	Countercyclical capital buffer ratio (CCyB ratio)	<p>Report the CCyB ratio for calculating an institution's buffer level under section 3G of the BCR as at the reporting date.</p> <p>The CCyB ratio reported in this item should be consistent with the ratio reported in the cell labelled "CCyB ratio" in column (8) of the Quarterly Reporting on the Countercyclical Capital Buffer (Form MA(BS)25).</p>
2.3	Higher loss absorbency ratio (HLA ratio)	Report the HLA ratio notified by the MA as applicable to the institution, if any, for calculating the institution's buffer level under section 3G of the BCR as at the reporting date.

Annex I-B

Illustrative examples to calculate the net CET1 capital ratio

Scenario 1

Suppose Bank A's risk-weighted amount is 100 units and it has 15 units of Total capital (comprising 14 units of CET1 capital and 1 unit of Tier 2 capital). Therefore, the CET1 capital ratio, Tier 1 capital ratio and Total capital ratio of Bank A are 14%, 14% and 15% respectively.

Taking into account Bank A's capital adequacy requirements imposed by the HKMA (assuming 5.3%, 7.1% and 9.5% for CET1 capital ratio, Tier 1 capital ratio and Total capital ratio respectively in this scenario), the calculation of the net CET1 capital ratio includes the following steps:

Tier of capital	CARs of Bank A	Bank A's capital requirement⁵ (as varied under s.97F of the BO)	CET1 capital required to meet Bank A's capital requirement	Remarks
CET1 capital	14.0%	5.3%	5.3 units	
Tier 1 capital	14.0%	7.1%	$= 5.3 + (7.1 - 5.3)$ $= 5.3 + 1.8$ $= 7.1$ units	Since Bank A has no Additional Tier 1 capital, the bank must make use of an additional 1.8 unit of CET1 capital to meet its Tier 1 capital requirement
Total capital	15.0%	9.5%	$= 7.1 + [(9.5 - 7.1) - 1]$ $= 7.1 + 1.4$ $= 8.5$ units	Since Bank A has only 1 unit of Tier 2 capital and no Additional Tier 1 capital, the bank must make use of an additional 1.4 unit of CET1 capital to meet its total capital requirement

Net CET1 Capital	$= 14.0 - 8.5$ $= 5.5$ units
Net CET1 Capital Ratio	$= 5.5 / 100$ $= 5.5\%$

Scenario 2

Suppose Bank B's risk-weighted amount is 100 units and it has 18 units of Total capital (comprising 14 units of CET1 capital, 2 units of Additional Tier 1 capital and 2 units of Tier 2 capital). Therefore, the CET1 capital ratio, Tier 1 capital ratio and Total capital ratio of Bank A are 14%, 16% and 18% respectively.

Taking into account Bank B's capital adequacy requirements imposed by the HKMA (assuming 5.3%, 7.1% and 9.5% for CET1 capital ratio, Tier 1 capital ratio and Total capital ratio respectively in this scenario), the calculation of the net CET1 capital ratio includes the following steps:

Tier of capital	CARs of Bank B	Bank B's capital requirement ⁶ (as varied under s.97F of the BO)	CET1 capital required to meet Bank B's capital requirement	Remarks
CET1 capital	14.0%	5.3%	5.3 units	
Tier 1 capital	16.0%	7.1%	5.3 units	Since Bank B has 2 units of Additional Tier 1 capital, the bank does not need to make use of additional units of CET1 capital to meet its Tier 1 capital requirement
Total capital	18.0%	9.5%	$= 9.5 - 2 - 2$ $= 5.5$ units	Since Bank B has 2 units of Additional Tier 1 capital and 2 units of Tier 2 capital, the bank needs to make use of an additional 0.2 unit of CET1 capital to meet its total capital requirement

Net CET 1 Capital	$= 14.0 - 5.5$ $= 8.5$ units
Net CET1 Capital Ratio	$= 8.5 / 100$ $= 8.5\%$

⁶ Please refer to subsection 3.5 of the HKMA Supervisory Policy Manual module CA-G-5 *Supervisory Review Process* for details on the apportionment of the P2A to the three minimum capital ratios (<http://www.hkma.gov.hk/media/eng/doc/key-functions/banking-stability/supervisory-policy-manual/CA-G-5.pdf>).

Completion Instructions

Return of Capital Adequacy Ratio Part II – Capital Base Form MA(BS)3(II)

Introduction

1. Form MA(BS)3(II) should be completed by an authorized institution incorporated in Hong Kong to determine its capital base for the calculation of capital adequacy ratios (CAR).
2. This Form and its completion instructions should be read in conjunction with Banking (Capital) Rules (**BCR**) and the relevant supervisory policy/guidance as applicable.
3. The institution shall refer to sections 2, 3 and 35 of the **BCR** for the interpretation of the terms used in this form and its completion instructions.
4. The overall structure of the capital base calculation according to Part 3 of the **BCR** is as follows –

Table A

	Components of Capital Base	Reference to the BCR
(A1)	Elements of Common Equity Tier 1 (CET1) Capital	Sections 38(1) and (3)
(A2)	Deductions from CET1 Capital (including items excluded under section 38(2))	Sections 38(2) and 43 to 46
(A3)	CET1 Capital = A1 – A2	
(A4)	Elements of Additional Tier 1 (AT1) Capital	Section 39
(A5)	Deductions from AT1 Capital	Section 47
(A6)	AT1 Capital = A4 – A5	
(A7)	Tier 1 (T1) Capital = A3 + A6	Section 37
(A8)	Elements of Tier 2 (T2) Capital	Section 40
(A9)	Deductions from T2 Capital	Section 48
(A10)	T2 Capital = A8 – A9	
(A11)	Total Capital = A7 + A10	Section 36

Specific Instructions

Item

Nature of item

Part II

Capital Base

5. For the purpose of calculating the institution's CAR, the capital base of the institution shall be the sum of the institution's Tier 1 capital (being the sum of the Common Equity Tier 1 (CET1) capital and Additional Tier 1 capital) and Tier 2 capital, calculated in Hong Kong dollars after taking into account items excluded under section 38(2) and regulatory deductions specified in Part 3 Division 4 and subject to the transitional arrangements specified in Schedule 4H of the BCR¹.
6. However, having considered its own circumstances, the institution may choose not to apply the transitional arrangements set out in section 5 of Schedule 4H for phasing out non-eligible capital instruments. Under that circumstance, the institution must inform the HKMA in writing of its decision, and must not change the decision thereafter without the prior consent of the HKMA.
7. The institution shall include in its CET1 capital, Additional Tier 1 capital or Tier 2 capital the proceeds of eligible instruments only to the extent that the instruments have been paid-up and are immediately available to the issuer of the instrument; or in the case of Additional Tier 1 or Tier 2 capital instruments are not issued out of an operating entity or any holding company of the institution, an operating entity or the holding company of the institution, as the case may be.
8. As outlined in paragraphs 59 and 84, if the institution has insufficient capital in a particular tier from which to make the required deductions, the remainder of the deduction amount (i.e. after bringing the net capital for that tier to zero) should be deducted from the next higher tier of capital. There are specific line items on the return to accommodate these transfers in deductions up the tiers.

¹ While the transitional arrangements provided to AIs in relation to (i) capital deductions and (ii) recognition of minority interests and capital instruments issued by consolidated bank subsidiaries and held by third parties in authorized institution's capital base have ceased from 1 January 2018, the phase-out of ineligible capital instruments continues until 31 December 2021.

<u>Item</u>	<u>Nature of item</u>
Category I	Common Equity Tier 1 capital²
(a)	<p><u>CET1 capital instruments</u></p> <p>9. Report the institution's (in case it is a joint-stock company) paid-up ordinary share capital (including voting ordinary shares and ordinary shares ranking equally with voting ordinary shares in all respects except the absence of voting rights) that meets the <i>Qualifying Criteria to be Met to be CET1 Capital</i> (CET1 Qualifying Criteria) set out in Schedule 4A of the BCR except any shares issued by the institution by virtue of capitalizing any property revaluation reserves of the institution referred to in item (l) of Category III below.</p> <p>10. Report the institution's (in case it is an entity other than a joint-stock company) capital instrument that is equivalent to ordinary shares in terms of loss absorption and meets the CET1 Qualifying Criteria set out in Schedule 4A.</p>
(b)	<p><u>Share premium</u></p> <p>11. Report the amount of the institution's share premium arising from the issue of CET1 capital instruments referred to in item (a) of Category I above.</p>
(c)	<p><u>Retained earnings</u></p> <p>12. Report in item (c) the amount of profits and losses of the institution brought forward pursuant to prevailing accounting standards as at a particular date which include the institution's –</p> <p>(i) unaudited profit or loss for the current financial year; and</p> <p>(ii) profit or loss of the immediately preceding financial year pending audit completion.</p> <p>The amount of profits and losses, if any, that has been related to sub-paragraphs (i) and (ii) above should be separately reported in item (c)(i).</p>

² Any capital instruments issued to third parties via a special purpose vehicle must not be included in an institution's CET1 capital.

(d) Disclosed reserves³

13. Report the institution's disclosed reserves in item (d). The amount of revaluation reserves in relation to financial assets at fair value through other comprehensive income that has been included in item (d) should be separately reported in item (d)(i).

(e) Minority interests arising from CET1 capital instruments issued by the consolidated bank subsidiaries of the institution and held by third parties

14. Where the MA requires under section 3C of the BCR that the CAR of the institution is to be calculated on a **consolidated basis** in respect of the institution's bank subsidiaries, report in item (e) the applicable amount of minority interests, arising from the CET1 capital instruments issued by the consolidated bank subsidiaries of the institution (including retained earnings and reserves) and held by third parties, which is recognized as CET1 capital of the institution on a consolidated basis, as calculated in accordance with sections 2(1) and 3 of Schedule 4D (*Requirements to be Met for Minority Interests and Capital Instruments Issued by Consolidated Bank Subsidiaries and Held by Third Parties to be Included in Authorized Institution's Capital Base*) of the BCR.
15. The maximum amount of minority interests in the bank subsidiary that can be included in the CET1 capital of the institution on a consolidated basis is calculated as:

$$A - (B * C)$$

where:

A gross amount of total qualifying CET1 capital instruments of the bank subsidiary issued to third parties

B (If the bank subsidiary is incorporated in Hong Kong)

surplus CET1 capital of the subsidiary = CET1 capital of the bank subsidiary (after taking into account items under section 38(2) and deductions under sections 43 to 46 of the BCR) less the lower of –

- i. the sum of risk-weighted amount for credit risk, market risk and operational risk of the bank

³

Excluding the amount of retained earnings reported in item (c) above.

subsidiary, calculated on a solo basis or a solo-consolidated basis, as the case may be, multiplied by the percentage equal to the sum of –

- (I) the minimum CET1 capital ratio that the bank subsidiary must comply with, on a solo basis or a solo-consolidated basis, as the case may be, under sections 3A and 3B of the **BCR**, and if applicable, as varied by the MA under section 97F of the Banking Ordinance (*specified minimum ratio*); and
- (II) 2.5%, or

(Item i. corresponds to the minimum CET1 capital requirement of the bank subsidiary plus the capital conservation buffer of 2.5%)

- ii. the portion of the sum of risk-weighted amount for credit risk, market risk and operational risk of the institution calculated on a consolidated basis, that relates to the bank subsidiary, multiply by the percentage equal to the sum of –

- (I) the minimum CET1 capital ratio that the institution must comply with on a consolidated basis, under sections 3A and 3B of the **BCR** and, if applicable, as varied by the MA under section 97F of the Banking Ordinance (*specified minimum ratio*); and
- (II) 2.5%.

(Item ii. corresponds to the portion, calculated as the consolidated minimum CET1 capital requirement plus the capital conservation buffer of 2.5%, that relates to the subsidiary)

Or

(If the bank subsidiary is not incorporated in Hong Kong)

surplus CET1 capital of the subsidiary = CET1 capital of the bank subsidiary (after taking into account items under section 38(2) and deductions under sections 43 to 46 of the **BCR**) less –

- iii. the portion of the sum of risk-weighted amount for

credit risk, market risk and operational risk of the institution calculated on a consolidated basis, that relates to the bank subsidiary, multiply by the percentage equal to the sum of –

- (I) the minimum CET1 capital ratio that the institution must comply with on a consolidated basis, under sections 3A and 3B of the **BCR** and, if applicable, as varied by the MA under section 97F of the Banking Ordinance (*specified minimum ratio*); and
- (II) 2.5%.

(Item iii. corresponds to the portion, calculated as the consolidated minimum CET1 capital requirement plus the capital conservation buffer of 2.5%, that relates to the subsidiary)

Note:

An institution may choose to use **4.5%** (*substitute percentage*) instead of the *specified minimum ratio* referred to in items B.i.(I), B.ii.(I) and B.iii.(I) above.

C percentage of CET1 capital instruments of the bank subsidiary held by third parties

- 16. The calculation as shown above must be undertaken for each individual bank subsidiary separately. If the institution has chosen to use the *substitute percentage*, it must not, without the MA's prior consent, use the *specified minimum ratio* subsequently. In addition, an institution must use only either the specified minimum ratio or the *substitute percentage* in respect of all of its bank subsidiaries that are members of its consolidation group.
- 17. **Annex II-A** is an illustrative example on how to calculate the applicable amount of minority interests and capital instruments issued by consolidated bank subsidiaries and held by third parties to be included in an institution's capital base.
- 18. Starting from 1 January 2018, any minority interest or a capital instrument issued by a subsidiary of the institution (that is subject to a section 3C requirement and held by third parties) which was no longer eligible for inclusion in the institution's capital base on 1 January 2013 but was included

in the calculation of the institution's core capital and supplementary capital before that date should be fully excluded from the capital base of the institution in accordance with the transitional arrangements specified in Table D of Schedule 4H of the BCR.

CET1 Capital Before Deductions (A)

19. This is the sum of items (a) to (e) in Column 2.

Regulatory deductions from CET1 Capital

20. The institution must exclude/deduct items (f)(i) to (f)(xxii) from its CET1 capital, if applicable, in accordance with the provisions set out in Part 3 of the BCR.

With respect to the regulatory deduction of an institution's capital investments in financial sector entities and commercial entities, **Annex II-B** provides an illustration showing the relevant components of different types of capital investments and loans, facilities or credit exposures that are required to be deducted from CET1 capital, Additional Tier 1 capital and Tier 2 capital under the **BCR**.

(f)(i) Cumulative cash flow hedge reserves that relate to the hedging of financial instruments that are not fair valued on the balance sheet

21. Report the amount of cumulative cash flow hedge reserves that relates to the hedging of financial instruments that are not fair valued on the balance sheet (including projected cash flows) in this item. **Net fair value losses on revaluation of cash flow hedge should be added back to the institution's CET1 capital and reported in item (f)(i) with a negative sign.**

(f)(ii) Cumulative fair value gains or losses on liabilities of the institution that are fair-valued and result from changes in the institution's own credit risk

22. Report the amount of cumulative fair value gains or losses on liabilities of the institution that are fair-valued and result from changes in the institution's own credit risk except any debit valuation adjustments for derivative contracts arising from the institution's own credit risk referred to in item (f)(xii). **Net fair value losses on revaluation of liabilities arising from changes in the institution's own credit risk should be added back to the institution's CET1 capital**

and reported in item (f)(ii) with a negative sign.

(f)(iii) Cumulative fair value gains arising from the revaluation of land and buildings

23. Report the amount of –

- (i) cumulative fair value gains arising from the revaluation of the institution's holdings of land and buildings (whether for the institution's own use or for investment purposes); and
- (ii) cumulative fair value gains generated from any transaction or arrangement entered into between the institution and another member of the institution's consolidation group involving the disposal of land and buildings (whether for the institution's own use or for investment purposes) that are held by the institution, or that other member, unless otherwise approved by the MA.

For the avoidance of doubt, such gains whether net or gross of deferred tax liability should be based on the prevailing accounting standards applicable within a given jurisdiction.

(f)(iv) Regulatory reserve for general banking risks⁴

24. Report the institution's regulatory reserve for general banking risks (either by earmarking approach or appropriation approach) referred to in section 38(2)(e) of the BCR.

(f)(v) Goodwill

25. Report the amount of any goodwill that is recognized by the institution as an intangible asset of the institution, net of any associated deferred tax liabilities.

(f)(vi) Other Intangible Assets

26. Report the amount of other intangible assets (including mortgage servicing rights) of the institution, net of any associated deferred tax liabilities. The amount of mortgage servicing rights that has been included in this item should be separately reported under item (f)(vi)(1).

⁴ Please refer to the HKMA's Regulatory Treatment of Expected Loss Provisions under Hong Kong Financial Reporting Standard 9 in Annex II-C.

(f)(vii)

Defined benefit pension fund assets

27. Report the assets of any defined benefit pension fund or plan (except those of such assets to which the institution can demonstrate to the satisfaction of the MA that it has unrestricted and unfettered access), net of the amount of obligations under the fund or plan and any associated deferred tax liabilities.

(f)(viii)

Deferred tax assets in excess of deferred tax liabilities

28. Report the amount of deferred tax assets, net of deferred tax liabilities (excluding those associated with and already net against the deduction of the amount of goodwill, other intangible assets and assets of any defined benefit pension fund or plan) of the institution.
29. Deferred tax assets may be netted with deferred tax liabilities only if the deferred tax assets and deferred tax liabilities relate to taxes levied by the same taxation authority and offsetting is permitted by the relevant taxation authority.

(f)(ix)

Credit-enhancing interest-only strip, and any gain-on-sale and other increase in the CET1 capital arising from securitization transactions

30. Report the amount of any credit-enhancing interest-only strip, and gain-on-sale and other increase in the CET1 capital resulting from securitization transactions (whether held in the banking book or trading book) in which the institution is the originating institution.
31. The amount to be reported in item (f)(ix) of Part II should be consistent with the sum of the figures reported in items B1, B2 and B3 under “Total amount” column of Division A of Form MA(BS)3(IIIId) and item B.1 under “Total” column of Division A.1(b) of Form MA(BS)3(IV).

(f)(x)

Securitization exposures specified in a notice given by the MA

32. Report the amount of any securitization exposure of the institution (whether held in the banking book or trading book) that the MA may, by notice in writing given to the institution, require the institution to deduct from its CET1 capital.
33. The amount to be reported in item (f)(x) of Part II should be consistent with the sum of the figures reported in item B4 under “Total amount” column of Division A of Form MA(BS)3(IIIId) and item B.2 under “Total” column of

Division A.1(b) of Form MA(BS)3(IV).

(f)(xi)

Valuation adjustments

34. Where the application of paragraph 4.5 of the SPM module on “Financial Instrument Fair Value Practices” (CA-S-10) has led to a lower carrying value than actually recognized under the current financial reporting standards as a result of valuation adjustments made, the absolute value of the difference should be reported in item (f)(xi) except:

- (i) if that exposure is a financial instrument that gives rise to the cash flow hedge reserves that fall within item (f)(i) above; and
- (ii) such part of the absolute value that have been taken into account in the calculation of the amount of the institution’s retained earnings or other disclosed reserves (or part of the retained earnings or other disclosed reserves) that fall within items (c) and (d) above.

(f)(xii)

Debit valuation adjustments (DVAs) in respect of derivative contracts

35. Report the amount of any DVAs made by the institution in respect of derivative contracts arising from the institution’s own credit risk (which must not be offset by any accounting valuation adjustments arising from the institution’s counterparty credit risk).

(f)(xiii)

Excess of total EL amount over total eligible provisions⁵ under the IRB Approach

36. For an institution that adopts the IRB approach for its credit risk, if its total EL amount exceeds its total eligible provisions, it must deduct the excess amount of total EL amount over total eligible provisions from the institution’s CET1 capital.

(f)(xiv)

Cumulative losses below depreciated cost arising from the institution’s holdings of land and buildings

37. Report any cumulative losses⁶ of the institution arising from

⁵ Please refer to the HKMA’s Regulatory Treatment of Expected Loss Provisions under Hong Kong Financial Reporting Standard 9 in Annex II-C.

⁶ The “cumulative losses” here refer to the losses represented by any negative difference between the fair value and the depreciated cost value of the institution’s properties (the latter is calculated as the cost of the building minus its accumulated depreciation, if any). To the extent that any amount of such “cumulative losses”

the institution's holdings of land and buildings below the depreciated cost value (whether or not any such land and buildings are held for the institution's own-use or for investment purposes) referred to in section 41(4) of the BCR.

(f)(xv)

Capital shortfall of regulated non-bank subsidiaries

38. Report the amount of any relevant capital shortfall as specified in a notice under section 45(1)(b) of the BCR given to the institution in respect of a subsidiary of the institution that is a securities firm or insurance firm.
39. The capital shortfall amount to be reported in item (f)(xv) is in addition to any other deductions the institution is required to make above, as applicable, from its CET1 capital in respect of the subsidiary concerned of the institution; and represents the amount by which that subsidiary is deficient in meeting its minimum capital requirements.
40. For the avoidance of doubt, the institution's investment in any of its subsidiary securities and/or insurance firms which are subject to deductions above, as applicable, should be net of any goodwill relating to such investment in subsidiary securities and/or insurance firms which is already deducted from CET1 capital and reported in item (f)(v) above.

(f)(xvi)

Investments in own CET1 capital instruments

41. Report the amount of any direct, indirect and synthetic holdings by the institution of its own CET1 capital instruments, unless already derecognized under applicable accounting standards, calculated in accordance with Schedule 4E of the BCR. For this purpose, the institution must:
 - (i) exclude holdings of capital instruments issued by financial sector entities that are not included within regulatory capital in the relevant financial sectors in which those entities operate;
 - (ii) reduce the amount to be deducted under item (f)(xvi) by any amount of goodwill (related to any holdings of shares falling within other items) already deducted under section 43(1)(a) of the BCR; and
 - (iii) include in the amount to be deducted under item (f)(xvi)

has not been recognised as "impairment loss" through profit and loss account, the amount will need to be deducted from CET1 capital.

potential future holdings that the institution could be contractually obliged to purchase. In this connection, the HKMA will generally follow the applicable accounting treatment. In case there are areas where the regulatory treatment is different from the accounting treatment, the HKMA will consider each scenario on a case by case basis. The general principle is that if a transaction is subject to conditions precedent which will lead to the institution holding a capital position upon completion of the transaction where the fulfilment of any of the outstanding conditions is beyond the control of the institution, it may treat the uncompleted transaction as not constituting a potent future holding.

(f)(xvii)

Reciprocal cross holdings in CET1 capital instruments

42. Report the amount of any direct, indirect and synthetic holdings by the institution of CET1 capital instruments issued by any financial sector entities where that entity has a reciprocal cross holding with the institution. For this purpose, the institution must:
 - (i) exclude holdings of capital instruments issued by financial sector entities that are not included within regulatory capital in the relevant financial sectors in which those entities operate;
 - (ii) reduce the amount to be deducted under item (f)(xvii) by any amount of goodwill (related to any holdings of shares falling within other items) already deducted under section 43(1)(a) of the BCR; and
 - (iii) include in the amount to be deducted under item (f)(xvii) potential future holdings that the institution could be contractually obliged to purchase. In this connection, the HKMA will generally follow the applicable accounting treatment. In case there are areas where the regulatory treatment is different from the accounting treatment, the HKMA will consider each scenario on a case by case basis. The general principle is that if a transaction is subject to conditions precedent which will lead to the institution holding a capital position upon completion of the transaction where the fulfilment of any of the outstanding conditions is beyond the control of the institution, it may treat the uncompleted transaction as not constituting a potent future holding.

- (f)(xviii) Capital investment in a connected company which is a commercial entity
- (f)(xviii)(1) Loans, facilities or other credit exposures that is required by section 46(1) of BCR to be aggregated with item (f)(xviii)

43. Report in item (f)(xviii) the amount of the sum of the following to the extent that such sum is in excess of 15% of the capital base of the institution as reported in its capital adequacy ratio return as at the immediately preceding calendar quarter end date:

- (i) the net book value of any capital investment in a connected company of the institution where that connected company is a commercial entity; and
- (ii) any loans, facilities or other credit exposures provided by the institution to any connected company of the institution where the connected company is a commercial entity as if such loans, facilities or other credit exposures were direct capital investment by the institution in the commercial entity, except where the institution demonstrates to the satisfaction of the MA that any such loan was made, facility granted or other credit exposure incurred in the ordinary course of business.

44. Report separately in item (f)(xviii)(1) the amount of any loans, facilities or other credit exposures described in paragraph 43(ii) above that is included in the amount reported in item (f)(xviii).

- (f)(xix) Insignificant capital investments in CET1 capital instruments issued by financial sector entities that are not subject to consolidation under a section 3C requirement

- (f)(xix)(1) Loans, facilities or other credit exposures that is required by section 46(2) of BCR to be aggregated with item (f)(xix)

45. Subject to paragraphs 46 and 47, report in item (f)(xix) the sum of the applicable amounts of the following:

- (i) the amount of direct, indirect and synthetic holdings of CET1 capital instruments issued by financial sector entities, calculated in accordance with Schedule 4F of the BCR, if – (a) the entities are not the subject of consolidation under a section 3C requirement; (b) the holdings are insignificant capital investments; and (c) the holdings do not otherwise fall within items (f)(xvi) and (f)(xvii) above; and

- (ii) any loans, facilities or other credit exposures provided by the institution to any connected companies of the institution where the connected company is a financial sector entity, except where the institution demonstrates to the satisfaction of the MA that any such loan was made, facility was granted or any such other credit exposure was incurred in the ordinary course of the institution's business.

46. For the purposes of paragraph 45(i), the institution must:

- (i) exclude holdings of capital instruments issued by financial sector entities that are not included within regulatory capital in the relevant financial sectors in which those entities operate;
- (ii) reduce the amount to be deducted under item (f)(xix) by any amount of goodwill (related to any holdings of shares falling within other items) already deducted under section 43(1)(a) of the BCR; and
- (iii) include in the amount to be deducted under item (f)(xix) potential future holdings that the institution could be contractually obliged to purchase. In this connection, the HKMA will generally follow the applicable accounting treatment. In case there are areas where the regulatory treatment is different from the accounting treatment, the HKMA will consider each scenario on a case by case basis. The general principle is that if a transaction is subject to conditions precedent which will lead to the institution holding a capital position upon completion of the transaction where the fulfilment of any of the outstanding conditions is beyond the control of the institution, it may treat the uncompleted transaction as not constituting a potent future holding.

47. For the purpose of determining the applicable amount to be deducted from the institution's CET1 capital under paragraph 45 above, such amount must be calculated by:

$$(D - E) * F$$

where:

- D** gross amount of the institution's aggregate holdings of insignificant capital instruments issued by and credit exposures to financial sector entities, as described in paragraph 45(i) and (ii) above

E 10% of the institution's CET1 capital, calculated after applying all deductions set out under items (f)(i) to (f)(xvii) and (f)(xxii)

F percentage of the institution's gross holdings of CET1 capital investments over the institution's aggregate gross holdings of insignificant capital investments

Annex II-D is an illustrative example on how to calculate the applicable amount of insignificant and significant capital investments to be deducted from CET1 capital, Additional Tier 1 capital and Tier 2 capital.

48. Report separately in item (f)(xix)(1) the amount of any loans, facilities or other credit exposures described in paragraph 45(ii) above that is included in the amount reported in item (f)(xix).

49. The amount of insignificant capital investments issued by financial sector entities that do not exceed the 10% threshold referred to in paragraph 47 (i.e. E) and that are not deducted from an institution's CET1 capital is to continue to be risk-weighted in accordance with the applicable risk-weight under Part 4, 5, 6 or 8 of the **BCR**, as the case requires.

(f)(xx) Significant capital investments in CET1 capital instruments issued by financial sector entities that are not subject to consolidation under a section 3C requirement

(f)(xx)(1) Loans, facilities or other credit exposures provided that is required by section 46(2) of **BCR** to be aggregated with item (f)(xx)

50. Subject to paragraphs 51 and 52, report in item (f)(xx) the sum of the applicable amounts of the following:

(i) the amount of the institution's direct, indirect and synthetic holdings of CET1 capital instruments issued by financial sector entities, calculated in accordance with Schedule 4G, if – (a) the entities are not the subject of consolidation under a section 3C requirement imposed on the institution; (b) the holdings are significant capital investments; and (c) the holdings do not otherwise fall within items (f)(xvi) and (f)(xvii) above; and

(ii) any loans, facilities or other credit exposures provided by the institution to any connected company of the institution where the connected company is a financial sector entity, except where the institution demonstrates to the satisfaction of the MA that any

such loan was made, facility was granted, or any such other credit exposure was incurred, in the ordinary course of the institution's business.

51. For the purposes of paragraph 50(i), the institution must:

- (i) exclude holdings of capital instruments issued by financial sector entities that are not included within regulatory capital in the relevant financial sectors in which those entities operate;
- (ii) reduce the amount to be deducted under item (f)(xx) by any amount of goodwill (related to any holdings of shares falling within other items) already deducted under section 43(1)(a) of the BCR; and
- (iii) include in the amount to be deducted under item (f)(xx) potential future holdings that the institution could be contractually obliged to purchase. In this connection, the HKMA will generally follow the applicable accounting treatment. In case there are areas where the regulatory treatment is different from the accounting treatment, the HKMA will consider each scenario on a case by case basis. The general principle is that if a transaction is subject to conditions precedent which will lead to the institution holding a capital position upon completion of the transaction where the fulfilment of any of the outstanding conditions is beyond the control of the institution, it may treat the uncompleted transaction as not constituting a potent future holding.

52. For the purpose of determining the applicable amount of an institution's significant CET1 capital instruments issued by financial sector entities referred to in paragraph 50 above, such amount must be calculated by:

$$(G - H)$$

where:

- G** gross amount of the institution's significant capital investments in CET1 capital instruments issued by and credit exposures to financial sector entities, as described in paragraphs 50(i) and (ii) above
- H** 10% of the institution's CET1 capital, calculated after applying all deductions under items (f)(i) to (f)(xix), (f)(xxi) and (f)(xxii)

Annex II-D is an illustrative example on how to calculate the applicable amount of insignificant and significant capital investments to be deducted from CET1 capital, Additional Tier 1 capital and Tier 2 capital.

53. Report separately in item (f)(xx)(1) the amount of any loans, facilities or other credit exposures described in paragraph 50(ii) above that is included in the amount reported in item (f)(xx).
54. The amount of an authorized institution's significant capital investment in CET1 capital instruments of a financial sector entity that does not exceed the 10% threshold referred to in paragraph 52 above and that is not deducted from its CET1 capital must be risk-weighted at 250%.

(f)(xxi)	<u>Direct holdings of CET1 capital instruments issued by financial entities that are members of the institution's consolidation group</u>
(f)(xxi)(1)	<u>Loans, facilities or other credit exposures that is required by section 46(2) of BCR to be aggregated with item (f)(xxi)</u>

55. Items (f)(xxi) and (f)(xxi)(1) are applicable only for institution who calculates its CAR on a solo/solo-consolidated basis under a section 3C requirement.
56. Subject to paragraph 57, report in item (f)(xxi) the sum of the applicable amounts of the following:
 - (i) the institution's direct holdings of CET1 capital instruments issued by financial sector entities that are members of the institution's consolidation group; and
 - (ii) any loans, facilities or other credit exposures provided by the institution to any connected companies of the institution where the connected company is a financial sector entity, except where the institution demonstrates to the satisfaction of the MA that any such loan was made, facility granted or other credit exposure incurred in the ordinary course of the institution's business.
57. For the purposes of paragraph 56(i) above, the institution must:
 - (i) exclude holdings of capital instruments issued by financial sector entities that are not included within regulatory capital in the relevant financial sectors in which those entities operate;

(ii) reduce the amount to be deducted under item (f)(xxi) by any amount of goodwill (related to any holdings of shares falling within other items) already deducted under section 43(1)(a) of the BCR; and

(iii) include in the amount to be deducted under item (f)(xxi) potential future holdings that the institution could be contractually obliged to purchase. In this connection, the HKMA will generally follow the applicable accounting treatment. In case there are areas where the regulatory treatment is different from the accounting treatment, the HKMA will consider each scenario on a case by case basis. The general principle is that if a transaction is subject to conditions precedent which will lead to the institution holding a capital position upon completion of the transaction where the fulfilment of any of the outstanding conditions is beyond the control of the institution, it may treat the uncompleted transaction as not constituting a potent future holding.

58. Report separately in item (f)(xxi)(1) the amount of any loans, facilities or other credit exposures described in paragraph 56(ii) above that is included in the amount reported in item (f)(xxi).

(f)(xxii)

Regulatory deductions applied to CET1 capital due to insufficient Additional Tier 1 capital to cover the required deductions

59. The institution should deduct from its CET1 capital the amount required to be deducted from Additional Tier 1 capital by virtue of section 47 of the BCR that exceeds the Additional Tier 1 capital of the institution.

60. If the institution's Additional Tier 1 capital before deductions (C) is less than the sum of deduction items (i)(i) to (i)(vi), then:

- report "0" in Additional Tier 1 capital after deductions (D); and
- report the sum of items (i)(i) to (i)(vi) minus Additional Tier 1 capital before deductions (C) in item (f)(xxii).

CET1 Capital After Deductions (B)

61. This is the sum of items (a) to (e) in Column 2 after making the deductions specifically required from CET1 capital (i.e. items (f)(i) to (f)(xxii)).

62. This is also the figure to be reported in item 1.1(i) of Division A of Form MA(BS)3(I).

Category II

Additional Tier 1 capital

- (g) Additional Tier 1 capital instruments issued and share premium
(g)(i) Amount of capital instruments reported in item (g) that is subject to phase out

63. Report in item (g) the amount of:

- (i) the institution's capital instruments that meet the *Qualifying Criteria to be Met to be Additional Tier 1 Capital* (AT1 Qualifying Criteria) set out in Schedule 4B of the **BCR**;
- (ii) the amount of the institution's share premium arising from the issue of capital instruments referred to in sub-paragraph (i) above; and
- (iii) the amount of capital instruments no longer qualified for inclusion in capital base after 1 January 2013 but eligible to be phased out from that date.

64. With respect to paragraph 63(iii) above, the capital instruments of the institution that were included in the institution's capital base immediately before 1 January 2013 but do not meet all the AT1 Qualifying Criteria set out in Schedule 4B must be phased out during the 10-year transition period beginning from that date. Report separately in item (g)(i) the amount of capital instruments issued before 1 January 2013 which are eligible to be phased out based on the transitional arrangements set out in **Annex II-E**.

Annex II-F contains an illustration for determining the extent of recognition of capital instruments as regulatory capital during the phase out period.

65. Additional Tier 1 capital instruments issued to third parties by the institution through a special purpose vehicle may be included in the Additional Tier 1 capital of the institution on a consolidated basis as if the institution itself had issued the capital instruments directly to third parties, provided that:

- (i) the special purpose vehicle is consolidated with the authorized institution;
- (ii) the capital instruments meet the AT1 Qualifying Criteria set out in Schedule 4B of the **BCR**; and
- (iii) the only asset of the special purpose vehicle is its investment in the capital of the institution in a form that

meets the AT1 Qualifying Criteria set out in Schedule 4B of the BCR⁷.

(h) Applicable amount of capital instruments issued by the consolidated bank subsidiaries of the institution and held by third parties

66. Where the MA requires under section 3C of the BCR that the CAR of the institution is to be calculated on a ***consolidated basis*** in respect of the institution's bank subsidiaries, report in item (h) the applicable amount of capital instruments issued by the consolidated bank subsidiaries of the institution and held by third parties, which is recognized as Additional Tier 1 capital of the institution on a consolidated basis, and calculated in accordance with sections 2(2) and 4 of Schedule 4D (*Requirements to be Met for Minority Interests and Capital Instruments Issued by Consolidated Bank Subsidiaries and held by Third Parties to be included in Authorized Institution's Capital Base*) of the BCR.

67. The maximum amount of Tier 1 capital instruments (i.e. CET1 capital instruments and Additional Tier 1 capital instruments) issued by the bank subsidiary to third parties that can be included in the Tier 1 capital of the institution on a consolidated basis is calculated as:

$$A - (B * C)$$

where:

A gross amount of total qualifying Tier 1 capital instruments of the bank subsidiary issued to third parties

B (If the bank subsidiary is incorporated in Hong Kong)

surplus Tier 1 capital of the bank subsidiary = Tier 1 capital of the bank subsidiary (after taking into account items under section 38(2) and deductions under sections 43 to 47 of the BCR) less the lower of

- i. the sum of risk-weighted amount for credit risk, market risk and operational risk of the bank subsidiary, calculated on a solo basis or a solo-consolidated basis, as the case may be, and multiplied by the percentage equal to the sum of—
 - (I) the minimum Tier 1 capital ratio that the

⁷ Assets that relate to the operation of the SPV may be excluded from this assessment if they are de minimis.

bank subsidiary must comply with, on a solo basis or a solo-consolidated basis, as the case may be, under sections 3A and 3B of the **BCR**, and if applicable, as varied by the MA under section 97F of the Banking Ordinance (*specified minimum ratio*); and

(II) 2.5%, or

(Item i. corresponds to the minimum Tier 1 capital requirement of the bank subsidiary plus the capital conservation buffer of 2.5%)

ii. the portion of the sum of risk-weighted amount for credit risk, market risk and operational risk of the institution calculated on a consolidated basis, that relates to the bank subsidiary, multiply by the percentage equal to the sum of—

(I) the minimum Tier 1 capital ratio that the institution must comply with, on a consolidated basis, under sections 3A and 3B of the **BCR** and, if applicable, as varied by the MA under section 97F of the Banking Ordinance (*specified minimum ratio*); and

(II) 2.5%.

(Item ii. corresponds to the portion, calculated as the consolidated minimum Tier 1 capital requirement plus the capital conservation buffer of 2.5%, that relates to the subsidiary)

Or

(If the bank subsidiary is not incorporated in Hong Kong)

surplus Tier 1 capital of the bank subsidiary = Tier 1 capital of the bank subsidiary (after taking into account items under section 38(2) and deductions under sections 43 to 47 of the **BCR**) less –

iii. the portion of the sum of risk-weighted amount for credit risk, market risk and operational risk of the institution calculated on a consolidated basis, that relates to the bank subsidiary, multiply by the percentage equal to the sum of –

(I) the minimum Tier 1 capital ratio that the institution must comply with, on a consolidated basis, under sections 3A and

3B of the **BCR** and, if applicable, as varied by the MA under section 97F of the Banking Ordinance (*specified minimum ratio*); and

(II) 2.5%.

(Item iii. corresponds to the portion, calculated as the consolidated minimum Tier 1 capital requirement plus the capital conservation buffer of 2.5%, that relates to the subsidiary)

Note:

An institution may choose to use **6%** (*substitute percentage*) instead of the *specified minimum ratio* referred to in items B.i.(I), B.ii.(I) and B.iii.(I) above.

C percentage of Tier 1 capital instruments of the bank subsidiary held by third parties

68. The amount of Tier 1 capital recognized in the Additional Tier 1 capital of an authorized institution on a consolidated basis must exclude the portion that has been recognized in the consolidated CET1 capital under paragraph 14 above.
69. The calculation as shown above must be undertaken for each individual bank subsidiary separately. If the institution has chosen to use the *substitute percentage*, it must not, without the MA's prior consent, use the specified minimum ratio subsequently. In addition, the institution must use only either the *specified minimum ratio* or the substitute percentage in respect of all of its bank subsidiaries that are members of its consolidation group.
70. **Annex II-A** is an illustrative example on how to calculate the applicable amount of minority interests and capital instruments issued by consolidated bank subsidiaries and held by third parties to be included in authorized institution's capital base.
71. Starting from 1 January 2018, any minority interest or a capital instrument issued by a subsidiary of the institution (that is subject to a section 3C requirement and held by third parties) which was no longer eligible for inclusion in the institution's capital base on 1 January 2013 but was included in the calculation of the institution's core capital before that date should be fully excluded from the capital base of the institution in accordance with section 4 of Schedule 4H of the BCR.

72. If the institution issues capital instrument to third parties through a special purpose vehicle via a consolidated bank subsidiary of the institution and -

- (i) the special purpose vehicle is consolidated with the bank subsidiary;
- (ii) the capital instruments meet the AT1 Qualifying Criteria set out in Schedule 4B of the BCR; and
- (iii) the only asset of the special purpose vehicle is its investment in the capital of the bank subsidiary in a form that meets the AT1 Qualifying Criteria set out in Schedule 4B of the BCR⁸,

the institution may treat the capital institutions as if the bank subsidiary itself had issued the capital instrument directly to the third parties, and may include the capital instruments in determining the applicable amount of the capital instruments to be included in the Additional Tier 1 capital of the institution on a consolidated basis as stipulated in paragraph 66 above.

Additional Tier 1 Capital Before Deductions (C)

73. This is the sum of items (g) and (h) in Column 2.

Regulatory deductions from Additional Tier 1 Capital

74. The institution must deduct the following items from its Additional Tier 1 capital in accordance with the provisions set out in Part 3 of the BCR.

With respect to the regulatory deduction of an institution's capital investments in financial sector entities and commercial entities, **Annex II-B** provides an illustration showing the relevant components of different types of capital investments and loans, facilities or credit exposures that are required to be deducted from CET1 capital, Additional Tier 1 capital and Tier 2 capital under the BCR.

⁸ Assets that relate to the operation of the SPV may be excluded from this assessment if they are de minimis.

(i)(i)

Investments in own Additional Tier 1 capital instruments

75. Report the amount of any direct, indirect and synthetic holdings by the institution of its own Additional Tier 1 capital instruments, unless already derecognized under applicable accounting standards, calculated in accordance with the provisions of Schedule 4E of the **BCR**. For this purpose, the institution must:

- (i) exclude holdings of capital instruments issued by financial sector entities that are not included within regulatory capital in the relevant financial sectors in which those entities operate;
- (ii) reduce the amount to be deducted under item (i)(i) by any amount of goodwill (related to any holdings of Additional Tier 1 capital instruments falling within other items) already deducted under section 43(1)(a) of the **BCR**; and
- (iii) include in the amount to be deducted under item (i)(i) potential future holdings that the institution could be contractually obliged to purchase. In this connection, the HKMA will generally follow the applicable accounting treatment. In case there are areas where the regulatory treatment is different from the accounting treatment, the HKMA will consider each scenario on a case by case basis. The general principle is that if a transaction is subject to conditions precedent which will lead to the institution holding a capital position upon completion of the transaction where the fulfilment of any of the outstanding conditions is beyond the control of the institution, it may treat the uncompleted transaction as not constituting a potent future holding.

(i)(ii)

Reciprocal cross holdings in Additional Tier 1 capital instruments

76. Report the amount of any direct, indirect and synthetic holdings by the institution of Additional Tier 1 capital instruments issued by financial sector entity where that entity has a reciprocal cross holding with the institution. For this purpose, the institution must:

- (i) exclude holdings of capital instruments issued by financial sector entities that are not included within regulatory capital in the relevant financial sectors in which those entities operate;
- (ii) reduce the amount to be deducted under item (i)(ii) by

any amount of goodwill (related to any holdings of shares falling within other items) already deducted under section 43(1)(a) of the BCR; and

- (iii) include in the amount to be deducted under item (i)(ii) potential future holdings that the institution could be contractually obliged to purchase. In this connection, the HKMA will generally follow the applicable accounting treatment. In case there are areas where the regulatory treatment is different from the accounting treatment, the HKMA will consider each scenario on a case by case basis. The general principle is that if a transaction is subject to conditions precedent which will lead to the institution holding a capital position upon completion of the transaction where the fulfilment of any of the outstanding conditions is beyond the control of the institution, it may treat the uncompleted transaction as not constituting a potent future holding.

(i)(iii) Insignificant capital investments in Additional Tier 1 capital instruments issued by financial sector entities that are not subject to consolidation under a section 3C requirement

77. Subject to paragraphs 78 below, report the applicable amount of the institution's direct, indirect and synthetic holdings of Additional Tier 1 capital instruments issued by financial sector entities, calculated in accordance with *Deduction of Holdings where Authorized Institution has Insignificant Capital Investments in Financial Sector Entities that are outside scope of Consolidation under Section 3C Requirement* (deduction for insignificant capital investments) set out in Schedule 4F of the BCR, if – (a) the entities are not the subject of consolidation under a section 3C requirement imposed on the institution; (b) the holdings are insignificant capital investments; and (c) the holdings do not otherwise fall within items (i)(i) and (i)(ii) above. For this purpose, the institution must:

- (i) exclude holdings of capital instruments issued by financial sector entities that are not included within regulatory capital in the relevant financial sectors in which those entities operate;
- (ii) reduce the amount to be deducted under item (i)(iii) by any amount of goodwill (related to any holdings of shares falling within other items) already deducted under section 43(1)(a) of the BCR; and
- (iii) include in the amount to be deducted under item (i)(iii)

potential future holdings that the institution could be contractually obliged to purchase. In this connection, the HKMA will generally follow the applicable accounting treatment. In case there are areas where the regulatory treatment is different from the accounting treatment, the HKMA will consider each scenario on a case by case basis. The general principle is that if a transaction is subject to conditions precedent which will lead to the institution holding a capital position upon completion of the transaction where the fulfilment of any of the outstanding conditions is beyond the control of the institution, it may treat the uncompleted transaction as not constituting a potent future holding.

78. For the purpose of determining the applicable amount to be deducted from the institution's Additional Tier 1 capital under paragraph 77 above, such amount must be calculated by:

$$(D - E) * F$$

where:

- D** gross amount of the institution's aggregate holdings of insignificant capital instruments issued by financial sector entities
- E** 10% of the institution's CET1 capital, calculated after applying all deductions under items (f)(i) to (f)(xvii) and (f)(xxii)
- F** percentage of the institution's gross holdings of Additional Tier 1 capital investments over the institution's aggregate gross holdings of insignificant capital investments

Annex II-D is an illustrative example on how to calculate the applicable amount of insignificant and significant investments to be deducted from CET1 capital, Additional Tier 1 capital and Tier 2 capital.

79. The amount of insignificant capital investments issued by financial sector entities that do not exceed the 10% threshold referred to in paragraph 78 above (i.e. E), and therefore not deducted from an institution's Additional Tier 1 capital, is to continue to be risk-weighted in accordance with the applicable risk-weight under Part 4, 5, 6 or 8 of the **BCR**, as the case requires.

(i)(iv)

Significant capital investments in Additional Tier 1 capital instruments issued by financial sector entities that are not subject to consolidation under a section 3C requirement

80. Subject to paragraph 81 below, report the amount of the institution's direct, indirect and synthetic holdings of Additional Tier 1 capital instruments issued by financial sector entities, calculated in accordance with the provisions of Schedule 4G (*Deduction of Holdings where Authorized Institution has Significant Capital Investment in Financial Sector Entities that are outside Scope of Consolidation under Section 3C Requirement*) of the BCR, if – (a) the entities are not the subject of consolidation under a section 3C requirement imposed on the institution; (b) the holdings are significant capital investments; and (c) the holdings do not otherwise fall within items (i)(i) and (i)(ii) above. For this purpose, the institution must:

- (i) exclude holdings of capital instruments issued by financial sector entities that are not included within regulatory capital in the relevant financial sectors in which those entities operate;
- (ii) reduce the amount to be deducted under item (i)(iv) by any amount of goodwill (related to any holdings of shares falling within other items) already deducted under section 43(1)(a) of the BCR; and
- (iii) include in the amount to be deducted under item (i)(iv) potential future holdings that the institution could be contractually obliged to purchase. In this connection, the HKMA will generally follow the applicable accounting treatment. In case there are areas where the regulatory treatment is different from the accounting treatment, the HKMA will consider each scenario on a case by case basis. The general principle is that if a transaction is subject to conditions precedent which will lead to the institution holding a capital position upon completion of the transaction where the fulfilment of any of the outstanding conditions is beyond the control of the institution, it may treat the uncompleted transaction as not constituting a potent future holding.

81. All significant capital investments in capital instruments issued by financial sector entities that are not in the form of CET1 capital instruments must be fully deducted from an authorized institution's Additional Tier 1 capital or Tier 2 capital, as the case requires, by reference to the tier of capital for which the capital instruments would qualify if they were

issued by the institution itself.

Annex II-D is an illustrative example on how to calculate the applicable amount of insignificant and significant investments to be deducted from CET1 capital, Additional Tier 1 capital and Tier 2 capital.

(i)(v)

Direct holdings of Additional Tier 1 capital instruments issued by financial sector entities that are members of the institution's consolidation group

82. Item (i)(v) is applicable only for institution who calculates its CAR on a solo/solo-consolidated basis under a section 3C requirement.

83. Report the amount of the institution's direct holdings of Additional Tier 1 capital instruments issued by financial sector entities that are members of the institution's consolidation group. For this purpose, the institution must:

- (i) exclude holdings of capital instruments issued by financial sector entities that are not included within regulatory capital in the relevant financial sectors in which those entities operate;
- (ii) reduce the amount to be deducted under item (i)(v) by any amount of goodwill (related to any holdings of shares falling within other items) already deducted under section 43(1)(a) of the BCR; and
- (iii) include in the amount to be deducted under item (i)(v) potential future holdings that the institution could be contractually obliged to purchase. In this connection, the HKMA will generally follow the applicable accounting treatment. In case there are areas where the regulatory treatment is different from the accounting treatment, the HKMA will consider each scenario on a case by case basis. The general principle is that if a transaction is subject to conditions precedent which will lead to the institution holding a capital position upon completion of the transaction where the fulfilment of any of the outstanding conditions is beyond the control of the institution, it may treat the uncompleted transaction as not constituting a potent future holding.

(i)(vi)

Regulatory deductions applied to Additional Tier 1 capital due to insufficient Tier 2 capital to cover the required deductions

84. The institution is required to make from its Tier 2 capital any

regulatory deductions by virtue of section 48 of the BCR. Such deductions must be applied to Additional Tier 1 capital in case Tier 2 capital of the institution is not sufficient to cover the required deductions.

85. If the institution's Tier 2 capital before deductions (**F**) is less than the sum of deduction items (r)(i) to (r)(v), then:
- report "0" in Tier 2 capital after deductions (**G**); and
 - report the sum of items (r)(i) to (r)(v) minus Tier 2 capital before deductions (**F**) in item (i)(vi).

Additional Tier 1 Capital After Deductions (**D**)

86. This is the sum of items (g) and (h) in Column 2 after making the deductions specifically required from Additional Tier 1 capital (i.e. items (i)(i) to (i)(vi)). However, if an institution's Additional Tier 1 capital before deductions (**C**) is less than the sum of deduction items (i)(i) to (i)(vi), then report "0" in Additional Tier 1 capital deductions (**D**) and follows the instructions set out in paragraph 60.
87. This is also the figure to be reported in item 1.1(ii) of Division A of Form MA(BS)3(I).

Tier 1 Capital (**E**)

88. This is the sum of CET1 capital after deductions (**B**) and Additional Tier 1 capital after deductions (**D**).
89. This is also the figure to be reported in item 1.1 of Division A of Form MA(BS)3(I).

Item Nature of item

Category III

Tier 2 Capital

- (j) Tier 2 capital instruments issued and share premium
(j)(i) Amount of capital instruments reported in item (j) that is subject to phase out arrangements

90. Report in item (j) the amount of:

- (i) the institution's capital instruments that meet the Tier 2 Qualifying Criteria as specified in Schedule 4C of the **BCR**;
- (ii) the amount of the institution's share premium arising from the issue of capital instruments referred to in sub-paragraph (i) above; and
- (iii) the amount of capital instruments no longer qualified for inclusion in capital base after 1 January 2013 but eligible to be phased out from that date.

91. With respect to paragraph **90**(iii), the capital instruments of the institution that were included in the institution's capital base immediately before 1 January 2013 but that do not meet all the qualifying criteria set out in Schedule 4C must be phased out during the 10-year transition period beginning from that date. Report separately in item (j)(i) the amount of capital instruments issued before 1 January 2013 which are eligible to be phased out based on the transitional arrangements set out in **Annex II-E**.

Annex II-F contains an illustration for determining the extent of recognition of capital instruments as regulatory capital during the phase out period.

92. Tier 2 capital instruments issued to third parties by the institution through a special purpose vehicle may be included in the Tier 2 capital of the institution on a consolidated basis as if the institution itself had issued the capital instruments to third parties, provided that:

- (i) the special purpose vehicle is consolidated with the authorized institution;
- (ii) the capital instruments meet the qualifying criteria set out in Schedule 4C of the **BCR**; and
- (iii) the only asset of the special purpose vehicle is its

investment in the capital of the institution in a form that meets the Tier 2 Qualifying Criteria set out in Schedule 4C of the BCR⁹.

(k) Applicable amount of capital instruments issued by the consolidated bank subsidiaries of the institution and held by third parties

93. Where the MA requires under section 3C of the BCR that the CAR of the institution is to be calculated on a ***consolidated basis*** in respect of the institution's bank subsidiaries, report in item (k) the applicable amount of capital instruments issued by the consolidated bank subsidiaries of the institution and held by third parties, which is recognized as Tier 2 capital of the institution on a consolidated basis, and calculated in accordance with sections 2(2) and 5 of Schedule 4D (*Requirements to be Met for Minority Interests and Capital Instruments Issued by Consolidated Bank Subsidiaries and held by Third Parties to be included in Authorized Institution's Capital Base*) of the BCR.

94. The maximum amount of all capital instruments (i.e. CET1 capital instruments, Additional Tier 1 capital instruments and Tier 2 capital instruments) issued by the bank subsidiary to third parties that can be included in the Total capital of the institution on a consolidated basis is calculated as:

$$A - (B * C)$$

where:

A gross amount of total qualifying capital instruments of the bank subsidiary issued to third parties

B (If the bank subsidiary is incorporated in Hong Kong)

surplus Total capital of the subsidiary = Total capital of the subsidiary (after taking into account items under section 38(2) and deductions under sections 43 to 48 of the BCR) less the lower of –

- i. the sum of risk-weighted amount for credit risk, market risk and operational risk of the bank subsidiary, calculated on a solo basis or a solo-consolidated basis, as the case may be, and multiply by the percentage equal to the sum of –

⁹ Assets that relate to the operation of the SPV may be excluded from the assessment if they are de minimis.

- (I) the minimum Total capital ratio that the bank subsidiary must comply with, on a solo basis or a solo-consolidated basis, as the case may be, under sections 3A and 3B of the **BCR**, and if applicable, as varied by the MA under section 97F of the Banking Ordinance (*specified minimum ratio*); and
- (II) 2.5%, or

(Item i. corresponds to the minimum Total capital requirement of the bank subsidiary plus the capital conservation buffer of 2.5%)

- ii. the portion of the sum of risk-weighted amount for credit risk, market risk and operational risk of the institution calculated on a consolidated basis, that relates to the bank subsidiary, multiply by the percentage equal to the sum of –
 - (I) the minimum Total capital ratio that the institution must comply with on a consolidated basis, under sections 3A and 3B of the **BCR** and, if applicable, as varied by the MA under section 97F of the Banking Ordinance (*specified minimum ratio*); and
 - (II) 2.5%.

(Item ii. corresponds to the portion, calculated as the consolidated minimum Total capital requirement plus the capital conservation buffer of 2.5% that relates to the subsidiary)

Or

(If the bank subsidiary is not incorporated in Hong Kong)

surplus Total capital of the subsidiary = Total capital of the subsidiary (after taking into account items under section 38(2) and deductions under sections 43 to 48 of the **BCR**) less –

- iii. the portion of the sum of risk-weighted amount for credit risk, market risk and operational risk of the institution calculated on a consolidated basis, that relates to the bank subsidiary, multiply by the percentage equal to the sum of –
 - (I) the minimum Total capital ratio that the institution must comply with on a

consolidated basis, under sections 3A and 3B of the **BCR** and, if applicable, as varied by the MA under section 97F of the Banking Ordinance (*specified minimum ratio*); and

(II) 2.5%.

(Item iii. corresponds to the portion, calculated as the consolidated minimum Total capital requirement plus the capital conservation buffer of 2.5% that relates to the subsidiary)

Note:

An institution may choose to use **8%** (*substitute percentage*) instead of the *specified minimum ratio* referred to in items B.i.(I), B.ii.(I) and B.iii.(I) above.

C percentage of total capital instruments of the subsidiary held by third parties

95. The amount of Total capital recognized in the Tier 2 capital of an authorized institution on a consolidated basis must exclude the portion that has been recognized in the consolidated Tier 1 capital under paragraph 66 above.
96. The calculation as shown above must be undertaken for each individual bank subsidiary separately. If the institution has chosen to use the substitute percentage, it must not, without the MA's prior consent, use the specified minimum ratio subsequently. In addition, the institution must use only either the specified minimum ratio or the substitute percentage in respect of all the bank subsidiaries of the institution that are members of its consolidation group.
97. **Annex II-A** is an illustrative example on how to calculate the applicable amount of minority interests and capital instruments issued by consolidated bank subsidiaries and held by third parties to be included in authorized institution's capital base.
98. Starting from 1 January 2018, any minority interest or a capital instrument issued by a subsidiary of the authorized institution (that is subject to a section 3C requirement and held by third parties) which was no longer eligible for inclusion in the institution's capital base on 1 January 2013 but was included in the calculation of the institution's supplementary capital before that date should be fully excluded from the capital base of the institution in

accordance with section 4 of Schedule 4H of the BCR.

99. If the institution issues Tier 2 capital instrument to third parties through a special purpose vehicle via a consolidated bank subsidiary and -

- (i) the special purpose vehicle is consolidated with the bank subsidiary;
- (ii) the capital instruments meet the Tier 2 Qualifying Criteria set out in Schedule 4C of the BCR; and
- (iii) the only asset of the special purpose vehicle is its investment in the capital of the bank subsidiary in a form that meets the Tier 2 Qualifying Criteria set out in Schedule 4C of the BCR¹⁰,

the institution may treat the capital institutions as if the bank subsidiary itself had issued the capital instrument directly to third parties, and may include the capital instruments in determining the applicable amount of the capital instruments to be included in the consolidated Additional Tier 1 capital of the institution as mentioned in paragraph 93 above.

(I) Reserves attributable to fair value gains on revaluation of the institution's holdings of land and buildings¹¹

100. Subject to paragraphs 101, 102, 103 and 105, report in this item the institution's reserves and retained earnings that is attributable to fair value gains arising from:

- (i) the revaluation of the institution's holdings of land and buildings except land and buildings mortgaged to the institution to secure a debt;
- (ii) the revaluation of the institution's share of the net asset value of any subsidiary of the institution to the extent that the value has changed as a result of the revaluation of the subsidiary's holdings of land and buildings except any land and buildings mortgaged to the subsidiary to secure a debt; and

(iii) disposal of land and buildings (whether for the

¹⁰ Assets that relate to the operation of the SPV may be excluded from the assessment if they are de minimis.

¹¹ According to sections 29, 30 and 31 of the BCR, the institution is allowed to deduct the portion of reserves not recognized in Tier 2 capital (i.e. the amount of the 55% haircut) from the institution's total risk-weighted amount. Such deductible amount should be reported in item 2.12(ii) of Division A of Form MA(BS)3(I).

institution's own-use or for investment purposes) referred to in section 38(2)(d) of the BCR.

Provided that:

- (a) the institution has a clearly documented policy on the frequency and method of revaluation of its holdings of land and buildings that is satisfactory to the MA;
- (b) the institution does not depart from that policy except after consultation with the MA;
- (c) subject to sub-paragraph (d) below, any revaluation of the institution's holdings of land and buildings is undertaken by an independent professional valuer;
- (d) in any case where the institution demonstrates to the satisfaction of the MA that, despite all reasonable efforts, it has been unable to obtain the services of an independent professional valuer to undertake the revaluation of all or part, as the case may be, of the institution's holdings of land and buildings, any revaluation of such holdings undertaken by a person who is not an independent professional valuer is endorsed in writing by an independent professional valuer;
- (e) any revaluation of the institution's holdings of land and buildings is approved by the institution's external auditors of the institution and explicitly reported in the institution's audited accounts; and
- (f) the fair value gains relating to paragraphs 100(i) to (iii) above are recognized in accordance with applicable accounting standards and any such gains not recognized in the financial statements of the institution are excluded.

101. The shares issued by the institution through capitalizing that part of the institution's reserves and retained earnings that is attributable to fair value gains described in paragraph 100 above is allowed to be added back in the institution's Tier 2 capital.

102. The amount of the fair value gains on revaluation of each of paragraphs 100(i) to (iii) above, which may be included in Tier 2 capital, shall not exceed 45% of each of such fair value gains (i.e. applying a haircut of 55% to each of such gains).

103. The institution must not, in calculating its Tier 2 capital, set-off losses in respect of the institution's own use land and buildings where such losses are recognized in the institution's profit or loss against unrealized gains that are reflected directly in the institution's equity through the statement of changes in equity.
104. The institution must deduct from its CET1 capital any cumulative losses of the institution arising from the institution's holdings of land and buildings below the depreciated cost value (whether or not any such land and buildings are held for the institution's own-use or for investment purposes). Such amount, if any, is to be reported in item (f)(xiv) above.
105. For the purposes of item (l), reserves attributable to fair value gains on revaluation of the institution's holdings of land and buildings. Whether the amount should be net or gross of deferred tax liability should be based on the prevailing accounting standards applicable within a given jurisdiction.

(m), (n) & (o)

Regulatory reserve for general banking risks and collective provisions^{12 13}

106. For an institution which uses only the STC approach or BSC approach to calculate its credit risk for non-securitization exposures, the institution must—

- (i) report its regulatory reserve for general banking risks in item (m) and collective provisions in item (n); and
- (ii) report the total of items (m) and (n) in item (o) up to an amount not exceeding 1.25% of the institution's aggregate risk-weighted amount for credit risk calculated by using the STC approach or BSC approach and by using any of the SEC-ERBA, SEC-SA and SEC-FBA. However, the risk-weighted amounts of exposures to CCPs and CVA, if any, are excluded.

107. For an institution which uses only the IRB approach, or a combination of the STC approach and IRB approach, to calculate its credit risk for non-securitization exposures, the

¹² According to sections 29, 30 and 31 of the BCR, the institution is allowed to deduct from its total risk-weighted amount the portion of its total regulatory reserve for general banking risks and collective provisions apportioned to the STC approach, BSC approach, SEC-ERBA, SEC-SA or SEC-FBA which is not included in Tier 2 capital. Such deductible amount should be reported in item 2.12(i) of Division A of Form MA(BS)3(I).

¹³ Please refer to the HKMA's Regulatory Treatment of Expected Loss Provisions under Hong Kong Financial Reporting Standard 9 in Annex II-C.

institution must—

(i) apportion its regulatory reserve for general banking risks and collective provisions between the STC approach, IRB approach, SEC-IRBA, SEC-ERBA, SEC-SA and SEC-FBA in accordance with section 42(2)(a) or (b) of the BCR, as the case may be. However, the risk-weighted amounts of exposures to CCPs and CVA, if any, are excluded for the operation of paragraph 107; and

(ii) after it has carried out the apportionment referred to in sub-paragraph (i) above —

(a) report its regulatory reserve for general banking risks apportioned to the STC approach, SEC-ERBA, SEC-SA and SEC-FBA (relevant approaches) in item (m) and its collective provisions apportioned to the relevant approaches in item (n);

(b) report the total of items (m) and (n) in item (o) up to an amount not exceeding 1.25% of its aggregate risk-weighted amount for credit risk calculated by using the relevant approaches; and

(c) comply with the instructions in paragraphs 108 and 109 below in respect of that portion of its regulatory reserve for general banking risks and collective provisions apportioned to the IRB approach and SEC-IRBA.

(p) Surplus provisions (for exposures calculated by using IRB approach)

108. For the institution that adopts the IRB approach for credit risk, if its total EL amount is less than its total eligible provisions, the institution may include the amount of the excess of the total eligible provisions over the total EL amount (i.e. the surplus provisions) in its Tier 2 capital up to 0.6% of its risk-weighted amount for credit risk calculated by using the IRB approach (that is to say, the credit RWA should exclude risk-weighted amounts for exposures to CCPs and CVA, if any). The amount to be reported in item (p) of Part II should be consistent with the figure reported in item 9 of Division F of Form MA(BS)3(IIIc).

(q) Regulatory reserve for general banking risks and collective provisions¹⁴ apportioned to SEC-IRBA

109. An institution falling within paragraph 107 above must report in item (q) that portion of its total regulatory reserve for general banking risks and collective provisions that is apportioned to the SEC-IRBA. The amount reported must not exceed 0.6% of its risk-weighted amount for credit risk calculated by using the SEC-IRBA.

Tier 2 Capital Before Deductions (F)

110. This is the sum of items (j), (k), (l), (o), (p) and (q) in Column 2.

Regulatory deductions from Tier 2 Capital

111. The institution must deduct from its Tier 2 capital in accordance with the provisions set out in Part 3 of the BCR.

With respect to the regulatory deduction of an institution's capital investments in financial sector entities and commercial entities, Annex II-B provides an illustration showing the relevant components of different types of capital investments and loans, facilities or credit exposures that are required to be deducted from CET1 capital, Additional Tier 1 capital and Tier 2 capital under the BCR.

(r)(i) Investments in own Tier 2 capital instruments

112. Report the amount of any direct, indirect and synthetic holdings by the institution of its own Tier 2 capital instruments, unless already derecognized under applicable accounting standards, calculated in accordance with the requirements specified in Schedule 4E of the BCR. For this purpose, the institution must:

- (i) exclude holdings of capital instruments issued by financial sector entities that are not included within regulatory capital in the relevant financial sectors in which those entities operate; and
- (ii) include in the amount to be deducted under item (r)(i) potential future holdings that the institution could be

¹⁴ Please refer to the HKMA's Regulatory Treatment of Expected Loss Provisions under Hong Kong Financial Reporting Standard 9 in Annex II-C.

contractually obliged to purchase. In this connection, the HKMA will generally follow the applicable accounting treatment. In case there are areas where the regulatory treatment is different from the accounting treatment, the HKMA will consider each scenario on a case by case basis. The general principle is that if a transaction is subject to conditions precedent which will lead to the institution holding a capital position upon completion of the transaction where the fulfilment of any of the outstanding conditions is beyond the control of the institution, it may treat the uncompleted transaction as not constituting a potent future holding.

(r)(ii)

Reciprocal cross holdings in Tier 2 capital instruments

113. Report the amount of any direct, indirect and synthetic holdings by the institution of Tier 2 capital instruments issued by financial sector entity where that entity has a reciprocal cross holding with the institution. For this purpose, the institution must:

- (i) exclude holdings of capital instruments issued by financial sector entities that are not included within regulatory capital in the relevant financial sectors in which those entities operate; and
- (ii) include in the amount to be deducted under item (r)(ii) potential future holdings that the institution could be contractually obliged to purchase. In this connection, the HKMA will generally follow the applicable accounting treatment. In case there are areas where the regulatory treatment is different from the accounting treatment, the HKMA will consider each scenario on a case by case basis. The general principle is that if a transaction is subject to conditions precedent which will lead to the institution holding a capital position upon completion of the transaction where the fulfilment of any of the outstanding conditions is beyond the control of the institution, it may treat the uncompleted transaction as not constituting a potent future holding.

(r)(iii)

Insignificant capital investments in Tier 2 capital instruments issued by financial sector entities that are not subject to consolidation under a section 3C requirement

114. Subject to paragraph 115 below, report the applicable amount of the institution's direct, indirect and synthetic holdings of Tier 2 capital instruments issued by financial sector entity, calculated in accordance with Schedule 4F of

the **BCR**, if – (a) the entities are not the subject of consolidation under a section 3C requirement imposed on the institution; (b) the holdings are insignificant capital investments; and (c) the holdings do not otherwise fall within items (r)(i) and (r)(ii) above. For this purpose, the institution must:

- (i) exclude holdings of capital instruments issued by financial sector entities that are not included within regulatory capital in the relevant financial sectors in which those entities operate; and
- (ii) include in the amount to be deducted under item (r)(iii) potential future holdings that the institution could be contractually obliged to purchase. In this connection, the HKMA will generally follow the applicable accounting treatment. In case there are areas where the regulatory treatment is different from the accounting treatment, the HKMA will consider each scenario on a case by case basis. The general principle is that if a transaction is subject to conditions precedent which will lead to the institution holding a capital position upon completion of the transaction where the fulfilment of any of the outstanding conditions is beyond the control of the institution, it may treat the uncompleted transaction as not constituting a potent future holding.

115. For the purpose of determining the applicable amount to be deducted from the institution's Tier 2 capital under paragraph **114** above, such amount must be calculated by:

$$(D - E) * F$$

where:

- D** gross amount of the institution's aggregate holdings of insignificant capital investments issued by financial sector entities
- E** 10% of the institution's CET1 capital, calculated after applying all deductions under items (f)(i) to (f)(xvii) and (f)(xxii)
- F** percentage of the institution's gross holdings of Tier 2 capital investments over the institution's aggregate gross holdings of insignificant capital investments

Annex II-D is an illustrative example on how to calculate the applicable amount of insignificant and significant

investments to be deducted from CET1 capital, Additional Tier 1 capital and Tier 2 capital.

116. The amount of insignificant capital investments issued by financial sector entities that do not exceed the 10% threshold referred to in paragraph 115 above (i.e. E) and therefore not deducted from an institution's Tier 2 capital, is continue to be risk-weighted in accordance with the applicable risk weight under Part 4, 5, 6 or 8 of the BCR, as the case requires.

(r)(iv)

Significant capital investments in Tier 2 capital instruments issued by financial sector entities that are not subject to consolidation under a section 3C requirement

117. Subject to paragraph 118 below, report the amount of the institution's direct, indirect and synthetic holdings of Tier 2 capital instruments issued by financial sector entities, calculated in accordance with Schedule 4G of the BCR, if – (a) the entities are not the subject of consolidation under a section 3C requirement imposed on the institution; (b) the holdings are significant capital investments; and (c) the holdings do not otherwise fall within items (r)(i) and (r)(ii) above. For this purpose, the institution must:

- (i) exclude holdings of capital instruments issued by financial sector entities that are not included within regulatory capital in the relevant financial sectors in which those entities operate; and
- (ii) include in the amount to be deducted under item (r)(iv) potential future holdings that the institution could be contractually obliged to purchase. In this connection, the HKMA will generally follow the applicable accounting treatment. In case there are areas where the regulatory treatment is different from the accounting treatment, the HKMA will consider each scenario on a case by case basis. The general principle is that if a transaction is subject to conditions precedent which will lead to the institution holding a capital position upon completion of the transaction where the fulfilment of any of the outstanding conditions is beyond the control of the institution, it may treat the uncompleted transaction as not constituting a potent future holding.

118. All significant capital investments in capital instruments issued by financial sector entities that are not in the form of CET1 capital instruments must be fully deducted from an authorized institution's Additional Tier 1 capital and Tier 2

capital, as the case requires, by reference to the tier of capital for which the capital instruments would qualify if they were issued by the institution itself.

Annex II-D is an illustrative example on how to calculate the applicable amount of insignificant and significant investments to be deducted from CET1 capital, Additional Tier 1 capital and Tier 2 capital.

(r)(v)

Direct holdings of Tier 2 capital instruments issued by financial sector entities that are members of the institution's consolidation group

119. Item (r)(v) is applicable only for institution who calculates its CAR on a solo/solo-consolidated basis under a section 3C requirement.
120. Report the amount of the institution's direct holdings of Tier 2 capital instruments issued by financial sector entities that are members of the institution's consolidation group. For this purpose, the institution must:
 - (i) exclude holdings of capital instruments issued by financial sector entities that are not included within regulatory capital in the relevant financial sectors in which those entities operate; and
 - (ii) include in the amount to be deducted under item (r)(v) potential future holdings that the institution could be contractually obliged to purchase. In this connection, the HKMA will generally follow the applicable accounting treatment. In case there are areas where the regulatory treatment is different from the accounting treatment, the HKMA will consider each scenario on a case by case basis. The general principle is that if a transaction is subject to conditions precedent which will lead to the institution holding a capital position upon completion of the transaction where the fulfilment of any of the outstanding conditions is beyond the control of the institution, it may treat the uncompleted transaction as not constituting a potent future holding.

Tier 2 Capital After Deductions (G)

121. This is the sum of items (j), (k), (l), (o) (p) and (q) in Column 2 after making the deductions specifically required from Tier 2 capital (i.e. items (r)(i) to (r)(v)).

122. If the institution's Tier 2 capital before deductions (**F**) is less than the sum of deduction items (r)(i) to (r)(v), then:
- report "0" in Tier 2 capital after deductions (**G**); and
 - report the sum of items (r)(i) to (r)(v) minus Tier 2 capital before deductions (**F**) in item (i)(vi).
123. This is also the figure to be reported in item 1.2 of Division A of Form MA(BS)3(I).

Capital Base

Capital Base (**H**)

124. This is the aggregate of Tier 1 capital after deductions (**E**) and Tier 2 capital after deductions (**G**).
125. This is also the figure to be reported in item 1.3 of Division A of Form MA(BS)3(I).

Hong Kong Monetary Authority
March 2018

Illustrative example to calculate the applicable amount of minority interests / Additional Tier 1 and Tier 2 capital instruments issued by consolidated bank subsidiaries and held by third parties to be recognized in CET1 capital, Additional Tier 1 capital and Tier 2 capital of an authorized institution

Suppose a bank subsidiary (Bank S) issued ordinary shares, Additional Tier 1 and Tier 2 capital instruments of \$90, \$40 and \$20 respectively, and third parties own 30% of the ordinary share, 50% of additional Tier 1 capital instruments and 75% of Tier 2 capital instruments. If Bank S has \$1,000 of total risk-weighted assets, its minimum CET1, Tier 1 and total capital requirements are assumed to be \$70, \$85 and \$105 (i.e. corresponding to a 7% CET1 capital ratio, 8.5% Tier 1 capital ratio and a 10.5% Total capital ratio)¹ respectively. Therefore, the applicable amount of minority interests is calculated as follows:

	(a)	(b)	(c)	(d)	(e)	(f)	(g)	(h)
	Capital issued by Bank S (gross of regulatory deductions)	Capital owned by third parties	Amount of minority interests $= ((a) * (b))$	Minimum capital ratio	Minimum capital requirement $= (RWA * (d))$	Surplus capital of subsidiary (net of deductions, if any) $= ((a) - (e))$	Surplus capital of subsidiary attributable to third parties $= ((f) * (b))$	Minority interests recognized $= ((c) - (g))$
CET1	\$90	30%	\$27	7%	\$70	\$20	\$6	\$21
AT1	\$40	50%	\$20					\$9.8
Tier 1	\$130	36%	\$47	8.5%	\$85	\$45	\$16.2	\$30.8
Tier 2	\$20	75%	\$15					\$12.7
Total capital	\$150	41%	\$62	10.5%	\$105	\$45	\$18.5	\$43.5
		C	A			B		

¹ The three percentage figures here are for illustrative purposes only. The exact figures to be used in reality will depend on whether Bank S is locally incorporated in Hong Kong or outside Hong Kong according to Schedule 4D of the **BCR**.

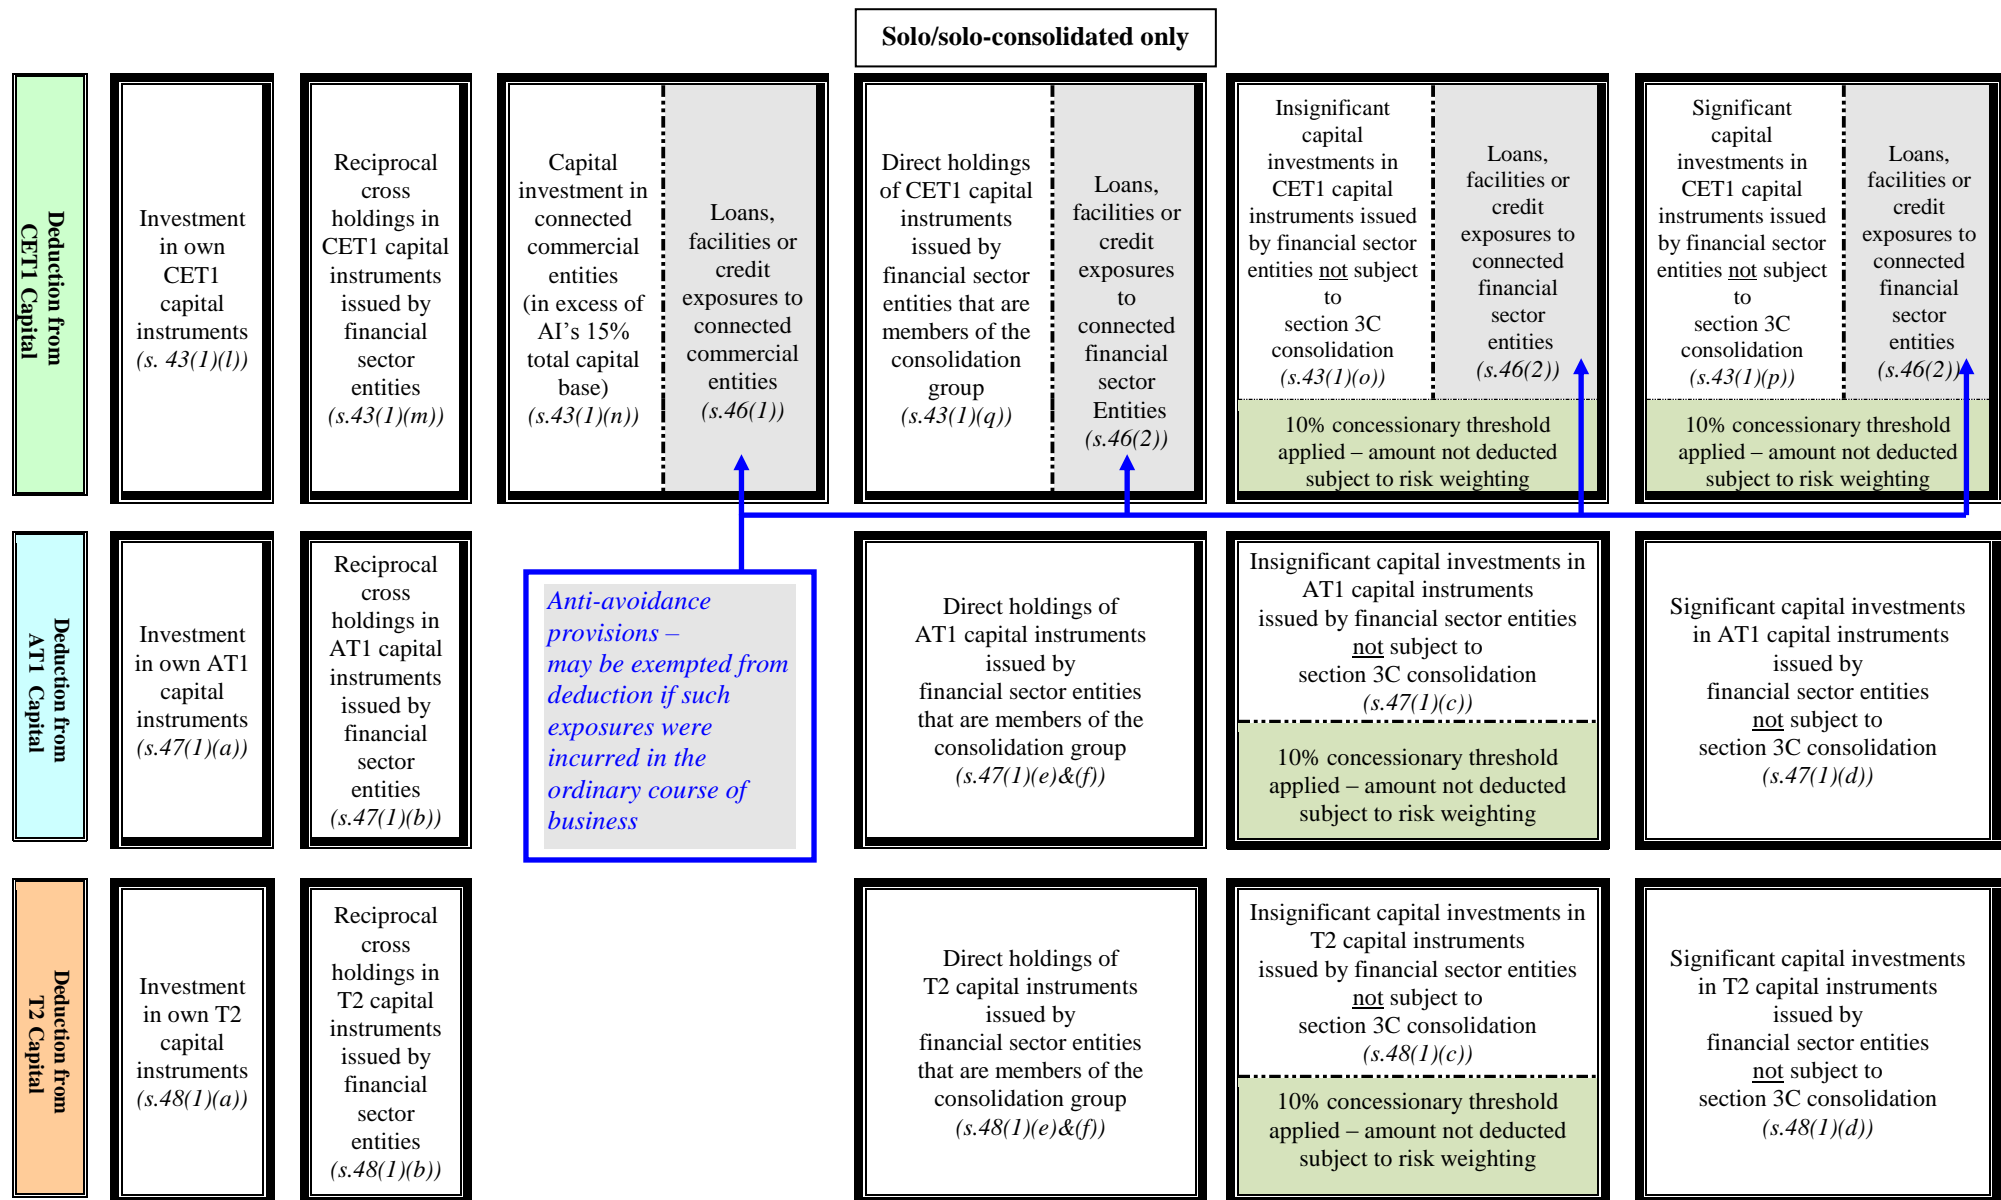

In this example, by using the formula $[A - (B * C)]$ as stipulated in paragraph 15 of the completion instructions, the amount of minority interest that can be recognized in the institution's consolidated CET1 capital is \$21 (i.e. $\$27 - (\$20 * 30\%)$).

Similarly, following the same formula above, the amount of Tier 1 capital instruments (including both CET1 and AT1 capital instruments) held by third parties that can be recognized in the institution's consolidated Tier 1 capital equals to \$30.8 (i.e. $\$47 - (\$45 * 36\%)$). Since \$21 has been recognized in the consolidated CET1 capital of the institution, only \$9.8 (i.e. $\$30.8 - \21) of such Tier 1 capital instruments can be included in its consolidated Additional Tier 1 capital.

The calculation of the applicable amount of Tier 2 capital instruments held by third parties to be included in an institution's Tier 2 follows the same methodology as shown above.

Deduction of capital investments and loans, facilities or credit exposures from capital base

Annex II-B

**Regulatory Treatment of Expected Loss Provisions under
Hong Kong Financial Reporting Standard 9 (HKFRS 9)**

Basel Committee on Banking Supervision (BCBS) interim standard

1. The BCBS regulatory capital standard requires banks to categorize accounting provisions made into general provisions (GP) and specific provisions (SP) for the purpose of capital treatment. Authorized institutions (AIs) using the standardised approach and basic approach for credit risk can include GP as Tier 2 capital up to 1.25% of credit RWAs while SP are netted off from risk-weighted exposures. For AIs using the IRB approach, the total eligible provisions (EP) (which include all accounting provisions) are compared with the regulatory measure of expected loss (EL) calculated based on predetermined parameters. Any shortfall of EP vis-a-vis EL is deducted from CET1 capital, and any excess of EP over EL is counted as Tier 2 capital up to 0.6% of credit RWAs.
2. As an interim measure for capital adequacy purposes pending the design and development of a longer-term solution, the BCBS issued on 29 March 2017 an interim standard on the regulatory treatment of accounting provisions², under which the current requirement to categorise banks' provisions into GP and SP and their respective treatment for regulatory capital calculation (as mentioned in paragraph 1 above) will remain unchanged when the "expected loss" provisioning model under International Financial Reporting Standard 9 (IFRS 9) comes into effect from 1 January 2018.

Capital treatment of expected loss provisions under the Banking (Capital) Rules (BCR)

3. To align with the expected loss provisions under the new HKFRS 9 (IFRS 9 equivalent), existing definitions for "collective provisions" (i.e. essentially GP) and "specific provisions" set out in section 2(1) of the BCR have been updated. The HKFRS 9 categorises financial assets into three stages in terms of credit impairment. For capital calculation, impairment provisions pertaining to exposures classified under the first two stages (i.e. Stage 1 and Stage 2) will be treated as GP, and those pertaining to exposures classified under Stage 3 as SP. With respect to provisions made for purchased or originated credit-impaired financial assets under which any changes in lifetime expected credit losses will be recognized in profit or loss account as an impairment gain or loss, the HKMA regards that such provisions to be similar in nature to SP and hence will be treated as such for capital adequacy purposes.

Determination of Regulatory Reserve (RR) under HKFRS 9

4. The following two-step approach should be adopted for determining whether any RR is required to be maintained by an AI on top of the provisions made by it under the new

² <http://www.bis.org/bcbs/publ/d401.pdf> Following the issuance of the interim standard, the BCBS continues to work on the development of a final standard to reflect expected loss provisioning within the regulatory capital framework.

accounting standard (please refer to the HKMA's consultation paper "Regulatory Treatment of Provisions under HKFRS 9" (CP 17.02)³ for details):

- (a) **Step 1** – calculating a benchmark regulatory provision for unidentified expected loss (benchmark) for each AI as the product of (i) a predetermined institution-specific "target rate" of the AI and (ii) the AI's total loans and advances (to non-banks);
- (b) **Step 2** – comparing the benchmark with the relevant portion of HKFRS 9 provisions made for the AI's total loans and advances to non-banks categorised into Stage 1 and Stage 2 under HKFRS 9 which, by definition, are not credit-impaired (i.e. they are provisions for unidentified expected loss); and
 - (i) where the benchmark is greater than the relevant portion of HKFRS 9 provisions, the "shortfall" will continue to be earmarked from retained earnings and maintained as RR;
 - (ii) where, on the other hand, the benchmark is equal to or smaller than relevant portion of HKFRS 9 provisions so that there is no "shortfall" or an "excess" of accounting provisions, no RR will be required.

³ The consultation paper is available at http://www.hkma.gov.hk/media/eng/doc/key-functions/banking-stability/basel-3/CP_17_02_HKFRS9.pdf

**Illustrative example to calculate the applicable amount of capital investments
of financial sector entities to be deducted from CET1 capital, Additional Tier 1 capital and Tier 2 capital**

Suppose Bank A holds the following capital instruments issued by financial sector entities that are not subject to a section 3C requirement and suppose further that Bank A has CET1 capital, Additional Tier 1 capital and Tier 2 capital of \$5,000, \$100 and \$250 respectively as at reporting date.

Types of capital investments	CET1 capital instruments	AT1 capital instruments	T2 capital instruments	Total
Insignificant	\$500	\$400	\$300	\$1,200
Significant	\$1,200	\$800	\$600	\$2,600

Part I (insignificant capital investments)

According to sections (2), (3) and (4) of Schedule 4F of the BCR, the applicable amount of insignificant capital investments to be deducted from the institution's capital base should be determined having regard to a concessionary threshold equal to –

- 10% of the institution's CET1 capital, which is calculated after applying –
- (i) all regulatory deductions set out under items (f)(i) to (f)(xvii); and
 - (ii) any deduction applied to CET1 capital due to insufficient Additional Tier 1 capital, if any.

The concessionary threshold should be derived based on the following two-stage approach.

Stage 1 – to find out the amount of insufficient Additional Tier 1 that is required to be deducted from Bank A’s CET1 capital (i.e. item (ii) in the text box on page 6)

Steps	Calculations	
1. Determine the 10% concessionary threshold without taking into account the deduction of item (ii), assuming the amount of regulatory deductions under item (i) to be \$1,000	CET1 capital before deductions - <i>Less: item (i) deductions</i> CET1 capital after deductions	\$5,000 <i>(\$1,000)</i> \$4,000
	Therefore, the 10% concessionary threshold = \$4,000 * 10% = \$400	
2. Apportionment of the applicable amount of CET1 capital investments to be deducted from CET1 capital	= (\$1,200 - \$400) * (\$500 / \$1,200) = \$333	
3. Apportionment of the applicable amount of Additional Tier 1 capital investments to be deducted from Additional Tier 1 capital	= (\$1,200 - \$400) * (\$400 / \$1,200) = \$267	
4. Apportionment of the applicable amount of Tier 2 capital investments to be deducted from Tier 2 capital	= (\$1,200 - \$400) * (\$300 / \$1,200) = \$200 ⁴	
5. Determine the amount of insufficient Additional Tier 1 capital that is required to be deducted from Bank A’s CET1 capital	= (\$267 - \$100) = \$167	

⁴

This amount, which is smaller than the available Tier 2 capital (i.e. \$250) of Bank A, will not contribute towards insufficient Additional Tier 1 capital.

Stage 2 – with the amount of insufficient Additional Tier 1 capital arrived at in Stage 1, we can now calculate the 10% concessionary threshold taking into account of both items (i) and (ii) in the text box on page 6

Steps	Calculations	
6. Determine the 10% concessionary threshold taking into account the regulatory deductions of both items (i) and (ii)	CET1 capital before deductions	\$5,000
	Less: item (i) deductions	(\$1,000)
	Less: item (ii) deductions	<u>(\$167)</u>
	CET1 capital after deductions	\$3,833
	Therefore, the 10% concessionary threshold = \$3,833 * 10% = \$383	

Consequently, Bank A's holding of insignificant capital investments in excess of 10% concessionary threshold is **\$817**, being \$1,200 minus \$383. The pro-rata calculation of respective amounts subject to (a) deduction from each tier of capital, and (b) risk-weighting in accordance with the applicable risk-weights under Part 4, 5, 6 or 8 of the BCR, as the case requires, will be as follows –

Table 1

(A)			
Amount subject to deduction		Amount subject to risk-weighting	Total
from CET1	= \$817 * (\$500/\$1,200) = \$341	= \$383 * (\$500/\$1,200) = \$159	\$500
from AT1	= \$817 * (\$400/\$1,200) = \$272	= \$383 * (\$400/\$1,200) = \$128	\$400
from T2	= \$817 * (\$300/\$1,200) = \$204	= \$383 * (\$300/\$1,200) = \$96	\$300
	\$817	\$383	\$1,200

Hence, the balance of CET1 capital, Additional Tier 1 capital and Tier 2 capital of Bank A after the deduction of insignificant capital investments in Part I will be –

Table 2

	CET1 capital	AT1 capital	Tier 2 capital	Remarks
Capital balance before regulatory deductions	5,000	100	250	
<i>Less: item (i) deductions</i>	<i>(1,000)</i>	<i>0</i>	<i>0</i>	
<i>Less: the applicable amount of insignificant capital investments to be deducted</i>	<i>(341)</i>	<i>(272)</i>	<i>(204)</i>	See column A of Table 1 on page 8
Sub-total			46	
		(172)		The shortage of \$172 AT1 capital to be deducted from CET1 capital
	3,659			
<i>Less: insufficient AT1 and Tier 2 capital (if any)</i>	<i>(172)</i>			
Balance brought forward to Part II	3,487	0	46	

Part II (significant capital investments)

According to sections (2) and (3) of Schedule 4G of the BCR, with respect to significant capital investments, the concessionary threshold only applies to the institution's capital investments in the form of CET1 capital instruments. Any holdings of Additional Tier 1 and Tier 2 capital instruments must be fully deducted from the institution's Additional Tier 1 capital or Tier 2 capital. The concessionary threshold for significant capital investment is equal to –

- 10% of the institution's CET1 capital, calculated after applying –
- (i) all regulatory deductions set out under items (f)(i) to (f)(xix), (f)(xxi); and
 - (ii) any deduction applied to CET1 capital due to insufficient Additional Tier 1 capital, if any.

The concessionary threshold should be derived based on the following workflow in case insufficient Additional Tier 1 capital is required to be deducted from Bank A's CET1 capital (i.e. item (ii) in the textbox above).

Table 3

	<u>CET1 capital</u>	<u>AT1 capital</u>	<u>Tier 2 capital</u>	<u>Remarks</u>
Balance brought down from Part I	3,487	0	46	See last row of Table 2 on page 9
<i>Less: full deduction of significant AT1 and Tier 2 capital investments</i>		(800)	(600)	
Sub-total			(554)	The shortage of \$554 Tier 2 capital to be deducted from AT1 capital
		(1,354)		The shortage of \$554 Tier 2 capital together with the shortage of \$800 AT1 capital (i.e. \$1,354 in total) to be deducted from CET1 capital
<i>Less: insufficient AT1 and Tier 2 capital to be deducted from CET1 capital</i>	(1,354)			
Balance after items (i) and (ii) deductions in the text box on page 10	2,133	0	0	Therefore, the 10% concessionary threshold for capital investments in the form of CET1 capital instruments (i.e. amount subject to 250% risk-weight) is $(\$2,133 * 10\%) = \213
<i>Less: Significant CET1 capital investments subject to deduction</i>	(987)			Amount of significant CET1 capital investments exceeding 10% concessionary threshold and subject to deduction: $(\$1,200 - \$213) = \$987$
Capital after deduction of significant capital investments	1,146	0	0	

Basel III Transitional Arrangements**Treatment of capital instruments that no longer qualify for inclusion in capital base (non-complying capital instruments)**

The following phase-out treatment will apply to non-complying capital instruments.

1. Non-common equity Tier 1 and Tier 2 capital instruments that do not qualify as Additional Tier 1 capital (i.e. failed to meet the qualifying criteria specified in Schedule 4B of the **BCR**) or Tier 2 capital (i.e. failed to meet the qualifying criteria specified in Schedule 4C of the **BCR**) but were included in an Authorized Institution's (AIs) capital base before 1 January 2013 (collectively referred to "extant capital instruments") may be phased out during the 10-year period beginning from 1 January 2013. Fixing the base at the nominal amount of such instruments outstanding immediately before 1 January 2013, their recognition will be capped at 90% from 1 January 2013, with the cap reducing by 10 percentage points in each subsequent year⁵. For example, an AI that issued a Tier 1 extant capital instrument in August 2010 will be able to count 90 percent of the notional outstanding amount of the instrument as of 1 January 2013 during calendar year 2013, 80 percent during calendar year 2014, and so on. As of 1 January 2022, no Tier 1 extant capital instruments will be recognized in Tier 1 capital.

Progressive phasing out of non-complying capital instruments

Commencement date	Percentage of base amount of transitional instruments that may be included in Additional Tier 1 and Tier 2 capital under the phase-out arrangement
1 January 2013	90%
1 January 2014	80%
1 January 2015	70%
1 January 2016	60%
1 January 2017	50%
1 January 2018	40%
1 January 2019	30%
1 January 2020	20%
1 January 2021	10%
1 January 2022	0%

2. This progressively reducing cap will be applied to Additional Tier 1 capital and Tier 2 capital separately based on the aggregate amount of extant capital instruments

⁵ The level of the base is fixed on 1 January 2013 and does not change thereafter.

outstanding in each tier⁶. To the extent that an instrument is redeemed, or its recognition in capital is amortized, after 1 January 2013, the nominal amount serving as the base is not reduced. In addition, instruments may only be included under a particular cap to the extent that they are recognized in that tier of capital. That is to say, any amount of instruments issued in excess of the limits allowed for recognition prior to 1 January 2013 (e.g. supplementary capital limited to the institution's core capital; and term debt capital limited to 50% core capital) will not be eligible for the gradual phasing-out treatment (i.e. any such excess amount should be excluded from the calculation of the base amount). Nevertheless, such instruments will be allowed to be fully recognized (i.e. without limitation) on and after 1 January 2013 if they meet all the qualifying criteria specified in Schedule 4B for inclusion in Additional Tier 1 capital or Schedule 4C for inclusion in Tier 2 capital of the BCR, as the case may be, and with the approval of the HKMA.

3. Where an instrument's recognition in capital is subject to amortization on or before 1 January 2013, only the amortized amount recognized in capital on 1 January 2013 should be taken into account in the amount fixed for transitioning rather than the full nominal amount. The instrument will continue to amortize on a straight-line basis at a rate of 20% per annum during the transition period, while the aggregate cap will be reduced at a rate of 10% per year.
4. Share premium may be included in the base provided that it relates to an instrument that is eligible to be included in the base for the transitional arrangements.
5. Non-qualifying instruments that are denominated in a foreign currency should be included in the base using their value in the reporting currency of the institution as at January 1, 2013. The base will be fixed in the reporting currency of the institution throughout the transition period. During the transition period, instruments denominated in a foreign currency should be valued as they are reported on the balance sheet of the institution at the relevant reporting date (adjusting for any amortization in the case of Tier 2 instruments).
6. Where an instrument is fully derecognized on 1 January 2013 or otherwise ineligible for these transitioning arrangements, the instrument must not be included in the base fixed on 1 January 2013.

Non-complying capital instruments eligible for phase-out treatment

7. The following rules will be applied to determine the extent to which non-complying capital instruments (issued by AI directly or through a subsidiary) are eligible for the phase-out treatment -
 - (a) Capital instruments issued prior to 12 September 2010 that previously qualified as regulatory capital but do not meet the Basel III qualifying criteria for regulatory capital (on a forward looking basis) will be considered non-complying capital instruments and subject to phase-out as described in this Annex.

⁶ Where an instrument is derecognized at 1 January 2013, it will not be eligible for grandfathering and does not count towards the base fixed on 1 January 2013.

- (b) Capital instruments issued before 1 January 1 2013 that meet the Basel III qualifying criteria for regulatory capital, except that they do not meet the “non-viability requirements”⁷, will be considered non-complying capital instruments and subject to the phase-out described in this Annex.
- (c) Capital instruments issued between 12 September 2010 and 1 January 2013 that do not meet one or more of the Basel III qualifying criteria for inclusion in regulatory capital (other than the non-viability requirements) will be excluded from regulatory capital as of 1 January 2013 (i.e. they will not be subject to the phase-out described in this Annex).
- (d) Capital instruments issued after 1 January 2013 must meet all of the Basel III criteria for regulatory capital (including the non-viability requirements) to qualify as regulatory capital. Instruments that do not meet all of these requirements will be excluded from regulatory capital for the purpose of determination of capital base.

8. Instruments with an incentive to redeem will be treated as follows:

Characteristics of capital instruments	Phase-out	Derecognize	Recognize
1. Call and step-up date prior to 1 January 2013, is not called and meets the new criteria			√
2. Call and step-up date on or after 1 January 2013, is not called and meets new criteria	√ Starting 1 January 2013 until effective maturity date		√ From effective maturity date onwards
3. Call and step-up date between 12 September 2010 and 1 January 2013, is not called and does not meet new criteria		√ On 1 January 2013	

⁷ Minimum requirements to ensure loss absorbency at the point of non-viability, Annex 1 of BCBS Press Release *Basel Committee issues final elements of the reforms to raise the quality of regulatory capital*, 13 January 2011.

Characteristics of capital instruments	Phase-out	Derecognize	Recognize
4. Call and step-up date on or after 1 January 2013, is not called and does not meet new criteria	√ Starting 1 January 2013 until effective maturity date	√ On effective maturity date	
5. Call and step-up date on or prior to 12 September 2010, was not called and does not meet new criteria	√ Starting 1 January 2013		

- (a) For an instrument that has a call and a step-up (or other incentive to redeem) prior to 1 January 2013, if the instrument is not called at its effective maturity date⁸ and on a forward-looking basis (i.e. from the effective maturity date) will meet the new criteria for inclusion in Additional Tier 1 capital or Tier 2 capital, it will continue to be recognized in that tier of capital.
- (b) For an instrument that has a call and a step-up (or other incentive to redeem) on or after 1 January 2013, if the instrument is not called and its effective maturity date and on a forward looking basis will meet the new criteria for inclusion in Additional Tier 1 capital or Tier 2 capital, it will continue to be recognized in that tier of capital. Prior to the effective maturity date, the instrument will be considered an “instrument that no longer qualifies as AT1 or Tier 2” and will therefore be phased out from 1 January 2013.
- (c) For an instrument that has a call and a step-up (or other incentive to redeem) between 12 September 2010 and 1 January 2013, if the instrument is not called at its effective maturity date and on a forward-looking basis (i.e. from the effective maturity date) will not meet the new criteria for inclusion in Additional Tier 1 capital or Tier 2 capital, it will be fully derecognized in that tier of capital from 1 January 2013.
- (d) For an instrument that has a call and a step-up (or other incentive to redeem) on or after 1 January 2013, if the instrument is not called at its effective maturity date and on a forward-looking basis (i.e. from the effective maturity date) will not meet the new criteria for inclusion in Additional Tier 1 capital or Tier 2 capital, it will be fully derecognized in that tier of capital from the effective maturity date. Prior to the effective maturity date, the instrument will be considered an “instrument that no longer qualifies as AT1 or Tier 2” and will therefore be phased out from 1 January 2013.

⁸ Effective maturity date refers to the incentive to redeem date. Instruments without an incentive to redeem would not have an effective maturity date other than their scheduled maturity (if any).

- (e) For an instrument that has a call and a step-up (or other incentive to redeem) on or prior to 12 September 2010, if the instrument was not called at its effective maturity date and on a forward-looking basis (i.e. from the effective maturity date) does not meet the new criteria for inclusion in Additional Tier 1 capital or Tier 2 capital, it will be considered an “instrument that no longer qualifies as AT1 or Tier 2” and will therefore be phased out from 1 January 2013.

Illustrative example –
Recognition of non-qualifying capital instruments during the transitional period

Subject to Schedule 4H of the **BCR**, the extant capital instruments of an authorized institution that were included in the institution's capital base immediately before 1 January 2013 but do not meet all the qualifying criteria set out in Schedule 4B and 4C of the **BCR**, as the case may be, must be phased out during the 10-year period.

Assume Bank A has three outstanding non-qualifying Tier 2 debt instruments as at 1 January 2013 which are eligible for phase-out:

- (a) **10-year Term Debt:** Notional amount of \$1,000 to be matured on 1 January 2019;
- (b) **10-year Term Debt:** Notional amount of \$500 with a call option on 1 January 2015 (assume that it will be derecognized after 1 January 2015)
- (c) **Perpetual Debt:** Notional amount of \$500

Based on the above information, the amount of non-qualifying capital instruments that may be recognized in Tier 2 capital of Bank A from 1 January 2013 to 31 December 2022 has been worked out in the following table. Authorized institutions are suggested to follow the below 4 steps in deriving the eligible amount that can be included as part of its capital base each year during the phase-out period.

- Step 1: Consider the maturity profile of each non-compliant instrument, including the 5-year amortization
- Step 2: Calculate the total amount of all non-compliant capital instruments [**A**]
- Step 3: Calculate the capped amount (subject to 10% phase-out) by fixing the base on 1 January 2013 [**B**]
- Step 4: The lower of either [A] or [B] is the amount that could be recognized as Tier 2 capital [**Min (A,B)**]

Reporting Date	Step 1			Step 2	Step 3	Step 4
	Debt (a)	Debt (b)	Debt (c)	Total amount of all non-compliant capital instruments [A]	Cap amount at each year [#] [B]	Amount that may be recognized in Tier 2 capital [Min (A,B)]
1/1/2013	\$1,000	\$500	\$500	\$2,000	\$1,800	\$1,800
1/1/2014	\$1,000	\$500	\$500	\$2,000	\$1,600	\$1,600
1/1/2015	\$800 [*]	\$0	\$500	\$1,300	\$1,400	\$1,300
1/1/2016	\$600	\$0	\$500	\$1,100	\$1,200	\$1,100
1/1/2017	\$400	\$0	\$500	\$900	\$1,000	\$900
1/1/2018	\$200	\$0	\$500	\$700	\$800	\$700
1/1/2019	\$0	\$0	\$500	\$500	\$600	\$500
1/1/2020	\$0	\$0	\$500	\$500	\$400	\$400
1/1/2021	\$0	\$0	\$500	\$500	\$200	\$200
1/1/2022	\$0	\$0	\$500	\$500	\$0	\$0

Note:

* Debt (a) starts in 2015 the 20% straight line amortization in the remaining 5 year before maturity.

The extant Tier 2 capital instruments subject to phase-out as at 1.1.2013 are \$2,000. Therefore, this cap amount will be reduced by 10 percentage points in each subsequent year.

Completion Instructions

Return of Capital Adequacy Ratio Part IIIa - Risk-weighted Amount for Credit Risk Basic Approach Form MA(BS)3(IIIa)

Introduction

1. Form MA(BS)3(IIIa) of Part III should be completed by each authorized institution (AI) incorporated in Hong Kong using the ***basic approach (BSC approach)*** to calculate ***credit risk*** under Part 5 of the Banking (Capital) Rules (BCR).
2. This Form covers the following exposures of a reporting AI:
 - (a) All on-balance sheet exposures and off-balance sheet exposures booked in its ***banking book***, except:
 - (i) exposures subject to deduction from the ***CET1 capital, additional tier 1 capital*** and/or ***tier 2 capital*** (which should be reported in Form MA(BS)3(II));
 - (ii) ***securitization exposures*** subject to Part 7 of the BCR (which should be reported in Form MA(BS)3(IIIId)); and
 - (iii) exposures to ***central counterparties*** (CCPs) subject to Division 4 of Part 6A of the BCR (which should be reported in Form MA(BS)3(IIIe)).
 - (b) All ***default risk exposures*** to counterparties under ***securities financing transactions*** (SFTs) (see paragraph 13 below) and ***derivative contracts*** booked in its ***trading book***, except:
 - (i) exposures subject to deduction from the CET1 capital, additional tier 1 capital and/or tier 2 capital; and
 - (ii) exposures to CCPs subject to Division 4 of Part 6A of the BCR (which should be reported in Form MA(BS)3(IIIe)).
 - (c) All credit exposures to persons arising from the persons holding collateral posted by the AI in a manner that is not bankruptcy remote from the persons except:
 - (i) exposures subject to deduction from the CET1 capital, additional tier 1 capital and/or tier 2 capital; and
 - (ii) exposures to CCPs subject to Division 4 of Part 6A of the BCR (which should be reported in Form MA(BS)3(IIIe)).

- (d) If applicable, the AI's market risk positions which are (i) exempted from the requirements of Part 8 of the BCR; and (ii) subject to Part 5 of the BCR as required by section 22(4)(c) of the BCR.
3. This Form and these completion instructions should be read in conjunction with the BCR and the relevant supervisory policy/guidance related to the capital adequacy framework.

Section A: Definitions and Clarification

4. The amounts reported in the column of "Principal Amount" should be net of *specific provisions* for all items in Division A and items 1 to 9, 18 and 24 in Division B, but gross of specific provisions for items 10 to 17 and 21 to 23 in Division B. For items 10 to 17 in Division B, specific provisions should be deducted from the *credit equivalent amount* (CEA) and the resulting figure should be reported in the column of "Credit Equivalent Amount". For items 21 to 23 in Division B, specific provisions should be deducted from the default risk exposure.
5. "Tier 1 countries" means Hong Kong, and any country or place other than Hong Kong—

- (a) which is a member of the Organization for Economic Co-operation and Development (OECD). Currently, OECD members comprise:

Australia	Germany	Mexico	Sweden
Austria	Greece	Netherlands	Switzerland
Belgium	Hungary	New Zealand	Turkey
Canada	Iceland	Norway	U.K.
Chile	Ireland	Poland	U.S.A.
Czech Republic	Israel	Portugal	
Denmark	Italy	Slovak Republic	
Estonia	Japan	South Korea	
Finland	Latvia	Slovenia	
France	Luxembourg	Spain	

or

- (b) which has concluded special lending arrangements with the International Monetary Fund associated with the Fund's General Arrangements to Borrow (at present only Saudi Arabia),

but excludes any such country or place—

- (c) which has rescheduled its external sovereign debt, whether to central government or non-central government creditors, within the previous five years; or
- (d) which is specified by the Monetary Authority (MA) as being a country or place that is not to be regarded as a Tier 1 country.

6. AIs and **banks** include their overseas head offices and branches. For example, a placement with a **Tier 2 country** incorporated AI or its overseas branch should be classified as an exposure to an AI regardless of the country of incorporation or location of its branch. A placement with a Tier 1 country incorporated bank's branch, regardless of its location, should be classified as an exposure to a bank incorporated in Tier 1 country.
7. Four types of credit risk mitigation (CRM) viz., collateral, netting, **guarantees** and **credit derivative contracts**, are recognized for the purpose of calculating capital requirement provided that they satisfy the relevant legal and operational requirements set out in—
 - (a) in the case of netting, section 2(1) (definition of “**valid bilateral netting agreement**”) or section 226B of the BCR, as the case requires;
 - (b) in the case of collateral, sections 124 and 125 of the BCR;
 - (c) in the case of guarantees, section 132 of the BCR; and
 - (d) in the case of credit derivative contracts, section 133 of the BCR.

To avoid doubt, guarantees issued by other offices of the reporting AI are not regarded as **recognized credit risk mitigation**. Debt securities which are **re-securitization exposures** (whether rated or not) cannot be recognized as collateral (see section 125(2) of the BCR). See Section C for capital treatment and reporting arrangement.

8. Double counting of exposures arising from the same contract or transaction should be avoided. For example, only the undrawn portion of a loan commitment should be reported as an off-balance sheet exposure under item 9a, b or c of Division B while the actual amount which has been lent out should be reported as an on-balance sheet exposure under the relevant class in Division A. **Trade-related contingencies**, such as trust receipts and shipping guarantees, to which the exposures have already been reported as letters of credit issued or loans against import bills etc. should not be reported under item 3 of Division B.
9. In certain cases, credit exposures arising from derivative contracts may already be reflected, in part, on the reporting AI's balance sheet. For example, the AI may have recorded **current exposures** to counterparties under exchange rate and interest rate contracts on its balance sheet. To avoid double counting, such exposures should be excluded from on-balance sheet exposures and treated as off-balance sheet exposures for the purposes of this Form.
10. Accruals on an exposure should be classified and risk-weighted in the same way as the exposure. Accruals which cannot be so classified should, with the **prior consent** of the MA, be included in Class VII - Other exposures.
11. For SFTs booked in the reporting AI's banking book, the credit exposures to assets underlying the SFTs should be risk-weighted using the “economic substance”

approach as described below and reported in Division A (if the securities are **non-securitization exposures**) or Form MA(BS)3(IIIId) (if the securities are securitization exposures):

- (a) repos of securities - the securities sold by the AI under the transaction should continue to be treated as assets on the balance sheet of the AI, with **regulatory capital** provided for the credit exposure to the securities (see also section 122(2) of the BCR);
- (b) reverse repos of securities - if the AI has acquired securities under reverse repo agreements, no regulatory capital is required for the money paid by the AI;
- (c) securities lending - the treatment is similar to that of repo transactions. The securities lent should continue to remain as assets on the balance sheet of the AI, with regulatory capital provided for the credit exposure to the securities (see also section 122(2) of the BCR); and
- (d) securities borrowing - if the collateral provided is not cash but securities, the securities should continue to remain as assets on the balance sheet of the AI, with regulatory capital provided for the credit exposure to the securities (see also section 122(4)(b) of the BCR).

If the securities underlying the SFTs are **securitization issues**, the AI should determine the risk-weight attributable to the securities in accordance with Part 7 of the BCR (see also section 122(5) of the BCR) and report the securities in Form MA(BS)3(IIIId) accordingly.

- 12. For SFTs booked in the reporting AI's trading book, the AI's exposures to the assets underlying the SFTs are market risk exposures. Hence, the AI only needs to calculate the **risk-weighted amounts** (RWAs) of its market risk exposures to the assets in accordance with Part 8 of the BCR (see section 123 of the BCR) and report the exposures in Form MA(BS)3(IV). The AI is not required to calculate any RWA for the credit risk of the assets. However, if the AI is granted an exemption under section 22 of the BCR, the AI should comply with section 122 instead of section 123 in calculating the RWAs of its exposures to the assets, and report the exposures in this Form instead.
- 13. The default risk exposures in respect of SFTs (regardless of whether they are booked in the banking book or trading book) should be reported in Division B in the following manner:
 - (a) Reporting AIs with the MA's approval to use the **internal models (counterparty credit risk) approach (IMM(CCR) approach)** to calculate the default risk exposures in respect of SFTs should report the exposures in items 21 to 23 of Division B (see paragraph 20 for the reporting arrangement) instead of item 18 of Division B.

(b) Reporting AIs without the MA's approval to use the IMM(CCR) approach (or which are permitted not to use the IMM(CCR) approach) to calculate the default risk exposures in respect of SFTs should calculate the exposures as follows:

- (i) repos of securities - the AI should treat the securities sold as if it were an on-balance sheet exposure to the counterparty concerned secured on the money received by the AI and calculate the **SFT risk-weighted amount** taking into account the CRM effect of the collateral (i.e. the money received) (see also section 123A(4) of the BCR);
- (ii) reverse repos of securities - the transaction should be treated as if it were a collateralized lending to the counterparty concerned and the SFT risk-weighted amount should be calculated with the CRM effect of the collateral (i.e. the securities purchased) taken into account (see also section 123A(5) of the BCR);
- (iii) securities lending – the securities lent should be treated as if it were an on-balance sheet exposure to the counterparty concerned secured on the money or securities received by the AI and the SFT risk-weighted amount should be calculated with the CRM effect of the collateral (i.e. the money or securities received) taken into account (see also section 123A(4) of the BCR);
- (iv) securities borrowing - the transaction should be treated as if it were an on-balance sheet exposure to the counterparty¹ secured on the securities borrowed and the SFT risk-weighted amount should be calculated with the CRM effect of the collateral (i.e. the securities borrowed) taken into account (see also section 123A(7) of the BCR); and
- (v) margin lending - the SFT risk-weighted amount of the transaction should be calculated with the CRM effect of the securities financed by the transaction taken into account (see also section 123A(6) of the BCR).

For the purposes of this paragraph, the collateral must meet the relevant criteria for qualifying as **recognized collateral** under the BCR.

14. An **originating institution** of a **non-eligible securitization transaction** must report the risk-weighted amount of the **underlying exposures** of the transaction in this Form as if the exposures were not securitized. The underlying exposures of an **eligible synthetic securitization transaction** must be reported in this Form in the same manner as a non-eligible securitization transaction except that the CRM for transferring the credit risk of the underlying exposures to the other parties to the transaction can be taken into account in the RWA calculation and therefore should also be included in the reporting. For cases which are not specified in these instructions or in any other supervisory guidance relevant to securitization transactions, reporting AIs should consult the HKMA on the reporting arrangements.

¹ For securities lending or borrowing where the contractual agreement is made between the securities borrower/lender and the custodian (e.g. Clearstream Banking or Euroclear Bank), and the securities borrower/lender has no knowledge of from/to whom the security is borrowed/lent, the custodian becomes the “counterparty” of the securities borrower/lender.

Section B: Exposure Classification, Determination of Credit Conversion Factors and Risk-weights

B.1 On-balance Sheet Exposures

Exposure Classification

15. Division A of the Form is organized according to the 8 standard classes into which on-balance sheet exposures should be classified under the BSC approach:

Class I	- <i>Sovereign</i> exposures
Class II	- <i>Public sector entity</i> exposures
Class III	- Multilateral development bank exposures
Class IV	- Bank exposures
Class V	- <i>Cash items</i>
Class VI	- <i>Residential mortgage loans</i>
Class VII	- Other exposures
Class VIII	- Exposures subject to 1250% risk-weight

16. The 8 classes are mutually exclusive and therefore each exposure should be reported under only one of them.

Determination of Risk-weights

17. The following explains how exposures in each class are risk-weighted, and, if applicable, the relevant reporting principles.

<u>Item</u>	<u>Nature of item</u>
-------------	-----------------------

Class I	Sovereign Exposures
----------------	----------------------------

Deposits placed with, and loans made to, the Government (including those for the account of the Exchange Fund and the clearing balances with the Exchange Fund) should be reported under item 1.

Market makers who have short positions in Exchange Fund Bills/Notes may report their net holdings of such instruments provided that the short positions are covered by the Sale and Repurchase Agreements with the HKMA. The following steps should be taken in determining the amount to be reported:

- the long and short positions of instruments with a residual maturity of less than 1 year may be offset with each other;
- the long and short positions of instruments with a residual maturity of not less than 1 year may be offset with each other;
- if the net positions of both (a) and (b) above are long, the positions should be reported under items 2 and 3 respectively;

(d) if the net positions in (a) is long and the net position in (b) is short, or the other way round, the two positions can be netted with each other on a dollar for dollar basis. The resultant net long position, if any, should be reported under item 2 or 3 as appropriate.

1. Loans to, or loans guaranteed by, sovereigns of Tier 1 countries are risk-weighted at 0%. The **credit protection covered portion** of loans covered by **recognized guarantees** given by the sovereigns of Tier 1 countries should be reported under this item.
2. Fixed rate debt securities with a residual maturity of less than 1 year, or floating rate debt securities of any maturity, issued by sovereigns of Tier 1 countries are risk-weighted at 10%.
3. Fixed rate debt securities with a residual maturity of not less than 1 year issued by sovereigns of Tier 1 countries are risk-weighted at 20%.
4. Fixed rate debt securities with a residual maturity of less than 1 year, or floating rate debt securities of any maturity, that are covered by recognized guarantees given by sovereigns of Tier 1 countries are risk-weighted at 10%.
5. Fixed rate debt securities with a residual maturity of not less than 1 year that are covered by recognized guarantees given by sovereigns of Tier 1 countries are risk-weighted at 20%.
6. Loans to, or loans guaranteed by, sovereigns of Tier 2 countries are risk-weighted at 0% if the loans are **domestic currency exposures**, (e.g. a Malaysian Ringgit loan which is granted to the Malaysian government and funded by Malaysian Ringgit liabilities). The credit protection covered portion of loans covered by recognized guarantees given by sovereigns of Tier 2 countries should be reported under this item.
7. Fixed rate debt securities with a residual maturity of less than 1 year, or floating rate debt securities of any maturity, issued by sovereigns of Tier 2 countries that are domestic currency exposures are risk-weighted at 10%.
8. Fixed rate debt securities with a residual maturity of not less than 1 year issued by sovereigns of Tier 2 countries that are domestic currency exposures are risk-weighted at 20%.
9. Fixed rate debt securities with a residual maturity of less than 1 year or floating rate debt securities of any maturity are risk-weighted at 10% if they are (i) covered by recognized guarantees given by

sovereigns of Tier 2 countries; and (ii) denominated and funded in the **local currencies** of the Tier 2 countries.

10. Fixed rate debt securities with a residual maturity of not less than 1 year are risk-weighted at 20% if they are (i) covered by recognized guarantees given by sovereigns of Tier 2 countries; and (ii) denominated and funded in the local currencies of the Tier 2 countries.

11. Exposures to Tier 2 countries, other than those reported under items 6 to 10, are risk-weighted at 100%.

12. Exposures to **relevant international organizations** are risk-weighted at 0%.

Class II Public Sector Entity (PSE) Exposures

13. Exposures to PSEs of Tier 1 countries are risk-weighted at 20%.

14. Exposures to PSEs of Tier 2 countries are risk-weighted at 100%.

Class III Multilateral Development Bank (MDB) Exposures

15. Exposures to MDBs are risk-weighted at 0%.

Class IV Bank Exposures

For the purposes of this class, **clean²** export trade bills negotiated under other banks' letters of credit may be reported as exposures to the issuing banks of the letters of credit.

16. Exposures to AIs are risk-weighted at 20%.

17. Exposures to banks incorporated in Tier 1 countries are risk-weighted at 20%.

18. Exposures to banks incorporated in Tier 2 countries with a residual maturity of less than 1 year are risk-weighted at 20%.

19. Exposures to banks incorporated in Tier 2 countries with a residual maturity of not less than 1 year are risk-weighted at 100%.

Class V Cash Items

20. Notes and coins are allocated a risk-weight of 0%.

21. Government certificates of indebtedness are allocated a risk-weight of 0%.

² This includes cases where discrepancies have been accepted by the issuing bank concerned.

22. Gold bullion held by the reporting AI or held by another person for the AI on an allocated basis, to the extent backed by gold bullion liabilities, is risk-weighted at 0%. Gold bullion held in safe custody for other entities or customers, to which the AI has no credit exposure, is not required to be included in this Form.

Gold bullion held for the AI on an unallocated basis by a third party, though backed by gold liabilities, should be risk-weighted as an exposure to that third party and reported under the class to which the third party belongs.

23. Gold bullion held not backed by gold liabilities (i.e. all other holdings of gold bullion not included in item 22 above) is risk-weighted at 100%.

24. Cash items in the course of collection refer to the amount of cheques, drafts and other items drawn on other banks that are payable to the account of the reporting AI immediately upon presentation and which are in the process of collection. Such items are allocated a risk-weight of 20%. Included are cheques and drafts against which the AI has paid to its customers (i.e. by purchasing or discounting the cheques or drafts presented by the customers) and in respect of which it now seeks payment from the drawee banks.

Import and export trade bills held by the AI which are in the process of collection should not be included in this item. They should be reported as exposures to the counterparty concerned and allocated a risk-weight applicable to the counterparty.

Unsettled clearing items under the interbank clearing system in Hong Kong and receivables arising from transactions in securities (other than *repo-style transactions*), foreign exchange, and *commodities* which are not yet due for settlement should be excluded.

- 25a. to e. Failed trade – delivery-versus-payment (DvP) basis

For any transaction in securities (other than repo-style transactions), foreign exchange, and commodities entered into on a ***delivery-versus-payment (DvP) basis***³ where payment / delivery has not yet taken place after the settlement date, the reporting AI should report the ***positive current exposure*** of the transaction in the column of “Principal Amount”. The RWA of the transaction is calculated by multiplying the positive current exposure of the transaction by the risk-weight corresponding to the length of the period of unsettlement (both the start and end days of the period inclusive).

³ DvP transactions include payment-versus-payment (PvP) transactions.

Failed trade – non-DvP basis

When such transaction is entered into on a non-DvP basis and payment / delivery from the counterparty has not yet taken place up to and including the fourth ***business day*** after the settlement date, the amount of the payment made or the current market value of the thing delivered by the AI, plus any positive current exposure associated with the transaction, should be treated as an exposure to that counterparty. The amount of the exposure should be reported under the class to which the counterparty belongs and risk-weighted at the risk-weight applicable to that counterparty.

When payment / delivery under any of the above non-DvP transactions has not yet taken place for five or more business days after the settlement date, the AI should report the exposure in item 29c.

26. Exposures collateralized by cash deposits held by the reporting AI (including certificates of deposit and comparable instruments issued by the AI) are risk-weighted at 0%. When a cash deposit pledged to the AI is held at third-party bank in a non-custodial arrangement, the AI should treat the cash deposit as an exposure to that third-party bank and report it in accordance with the instructions in Section C.

Class VI Residential Mortgage Loans (RMLs)

The ***credit protection uncovered portion***, if any, of the following RMLs should be reported under item 27a or 27c whichever is applicable:

- (A) RMLs granted for the purchase of flats under the Home Ownership Scheme, Private Sector Participation Scheme Tenants Purchase Scheme **and other similar schemes** which are covered by guarantees issued by the Housing Authority;
- (B) Reverse mortgage loans granted under the Reverse Mortgage Programme of The Hong Kong Mortgage Corporation Limited **(or its subsidiary)**; and
- (C) RMLs granted under Mortgage Insurance Programmes of The Hong Kong Mortgage Corporation Limited **(or its subsidiary)**.

The credit protection covered portion of the above RMLs should be reported in Class II in accordance with the instructions in Section C if the guarantee or insurance concerned meets all the criteria set out in section 132 of the BCR.

- 27a. RMLs that satisfy the criteria set out in section 115(1) of the BCR are risk-weighted at 50% and should be reported under this item.

27b. If the reporting AI has opted to risk-weight those RMLs that are secured by a first legal charge on residential properties situated outside Hong Kong according to the regulatory capital rules of the jurisdictions in which the properties are situated, the RMLs should be reported under this item if the risk-weights are other than 50% and 100%. RMLs that are risk-weighted at 50% or 100% according to those jurisdictions' regulatory capital rules should be reported under item 27a or 27c, whichever is applicable.

27c. Other RMLs, i.e. those which do not satisfy the criteria set out in sections 115(1) and 115(2) of the BCR, should be risk-weighted at 100% and reported under this item.

Class VII Other Exposures

Included in this class are all on-balance sheet exposures which are subject to credit risk capital requirements and have not been included in Classes I to VI and VIII in this Form. Exposures included in this class are subject to a risk-weight of 100%, unless otherwise specified in the BCR or by the MA. Examples of exposures to be included in this class are:

28a. Exposures to corporates or individuals not elsewhere reported

This refers to exposures to corporates or individuals which have not been included in other classes of exposures.

28b. Investments in equity or other capital instruments issued by financial sector entities (other than those subject to capital deduction or 250% risk-weight)

Included are investments in equity or other capital instruments issued by **financial sector entities** which are not subject to capital deduction or 250% risk-weight (see section 116 of the BCR).

28c. Investments in equity of other entities (other than those subject to 1250% risk-weight) and holding of collective investment schemes

Included are investments in **commercial entities** which are not subject to 1250% risk-weight (see sections 116 and 117A of the BCR). Holding of **collective investment schemes** should also be reported here.

28d. Premises, plant and equipment, other fixed assets for own use, and other interest in land

Included are investments in premises, plant and equipment and all other fixed assets of the reporting AI which are held for own use.

Fixed asset which is held by the AI as lessee under a finance lease in accordance with the Hong Kong Accounting Standard 17 issued by Hong Kong Institute of Certified Public Accountants is also included.

Other interests in land which are not occupied by the AI or used in the operation of the AI's business should also be reported here.

28e. Investments in capital instruments issued by financial sector entities (other than those subject to capital deduction)

Included are investments in equity or other capital instruments (whether rated or unrated) issued by financial sector entities which are subject to 250% risk-weight under section 116(2)(b) of the BCR.

28f. Multiple-name credit-linked notes

This item refers to multiple-name *credit-linked notes* (CLN) (e.g. first-to-default CLN) for which the applicable risk-weights are determined according to section 117(a)(ii) of the BCR. Also see paragraph 18(b) below.

28g. Other on-balance sheet exposures which are not elsewhere reported

This item refers to other investments or exposures which are not reported elsewhere, and may include any fixed asset leased by the reporting AI under an operating lease.

28h. If necessary, the MA may specify a risk-weight which is greater than 100% for an exposure falling within this class. Such exposure should be reported under this item.

This item also includes credit protection covered portions of exposures which are –

- secured by recognized collateral for which the applicable risk-weights are determined under Part 7 of the BCR; or
- covered by credit derivative contracts eligible for a risk-weight of 2% or 4% under section 134(7) or 135(6A) of the BCR (The credit protection covered portions should be reported as a separate item from the credit protection covered portions arising from other types of CRM. To avoid doubt, if section 119(f)(ii) or 226I(b) of the BCR applies to the credit derivative contracts concerned, the default risk exposures in respect of the contracts are regarded as zero for the purposes of Form MA(BS)3(IIIe).).

Class VIII Exposures subject to 1250% risk-weight

Report here the following types of on-balance sheet exposure which are subject to a risk-weight of 1250%.

29a. First loss portion of credit protection

This item refers to the first loss portion mentioned in sections 135(2) and (8) of the BCR.

29b. Significant exposures to commercial entities

This item refers to the reporting AI's holdings of shares in commercial entities that exceed the threshold set out in section 117A of the BCR.

29c. Non-DvP transactions remain unsettled for 5 or more business days

This item refers to the amount of payment made or the current market value of things delivered by the reporting AI, plus any positive current exposure, in respect of securities (other than repo-style transactions), foreign exchange and commodities transactions entered into on a basis other than a DvP basis, where the payment or deliverables from the counterparty remain unsettled after the contractual settlement date for 5 or more business days (see also section 114A of the BCR).

18. Risk-weights for Credit-linked Notes held

- (a) A single-name CLN held by the reporting AI should be allocated a risk-weight which is the higher of the risk-weight of the **reference obligation** of the note and the risk-weight of the note issuer. The amount of the exposure, which is the book value of the note, should be reported under the relevant class in Division A.
- (b) If the note is a multiple-name CLN (e.g. a first-to-default CLN), the risk-weighting method mentioned in paragraph (a) applies except that the AI should determine the risk-weight of the basket of reference obligations according to the principles set out in section 117(a)(ii) of the BCR (see paragraph 27(g) in Section B.2 below for explanation). The CLN should be reported in Division A under the class applicable to the issuer of the note if the risk-weight of the issuer is assigned to the CLN, otherwise, the CLN should be reported under Class VII item 28f in that Division.

B.2 Off-balance Sheet Exposures

Classification and Determination of Credit Conversion Factors

19. The reporting AI should classify its off-balance sheet exposures into the appropriate standard items listed below and report the ***principal amount*** and the RWA of each exposure based on the instructions set out in Section C.
20. ***Credit conversion factors*** (CCFs) for items 1 to 9 are set out in section 118(1) of the BCR. CCFs for items 10 to 17 and 24 are set out in sections 118(2) and 120 of the BCR respectively (also see paragraphs 21 to 25 for explanation).

<u>Item</u>	<u>Nature of item</u>
1.	<i>Direct credit substitutes</i>
2.	<i>Transaction-related contingencies</i>
3.	Trade-related contingencies
4.	<i>Asset sales with recourse</i>
5.	<i>Forward asset purchases</i>
6.	<i>Partly paid-up shares and securities</i>
7.	<i>Forward forward deposits placed</i>

This refers to a commitment to place a forward forward deposit. If the reporting AI has contracted to receive a forward forward deposit, failure to deliver by the counterparty will result in an unanticipated change in the AI's interest rate exposure and may involve a replacement cost. Such exposure should therefore be accorded the same treatment as ***interest rate contracts*** and reported under item 11 below.

8. ***Note issuance and revolving underwriting facilities***

- 9a. to c. Other commitments

Included is the undrawn portion of any binding arrangements which obligate the reporting AI to provide funds or to incur off-balance sheet exposures (e.g. commitment to issue letters of credit or performance bonds) at some future dates. The latter does not include commitments to enter into OTC derivative transactions / credit derivative contracts.

A commitment is regarded as being created no later than the acceptance in writing by the customer of the facility offered.

In the case of an off-balance sheet exposure (exposure A) arising from a commitment the drawdown of which will give rise to another off-balance sheet exposure (exposure B) falling within any of items 1 to 8 and 24, the CCF applicable to exposure A should be the lower of—

- the CCF applicable to exposure A based on the original maturity⁴ of the commitment and whether it can be cancelled at any time unconditionally; and
- the CCF applicable to exposure B.

If the commitment is in the form of a general banking facility consisting of 2 or more credit lines (including lines for entering into OTC derivative transactions / credit derivative contracts), the AI should assign a CCF to exposure A based on the original maturity of the commitment and whether the commitment can be unconditionally cancelled at any time.

9a. This item includes off-balance sheet exposures arising from commitments which are unconditionally cancellable without prior notice by the reporting AI other than for “force majeure” reason, or which effectively provide for automatic cancellation due to deterioration in a borrower’s creditworthiness. This also includes any revolving or undated/open-ended commitments, e.g. overdrafts or unused credit card lines, provided that they can be unconditionally cancelled at any time and subject to credit review at least annually.

9b. This item captures other off-balance sheet exposures arising from—

- commitments with an original maturity of up to one year; or
- commitments the drawdown of which would give rise to off-balance sheet exposures subject to a CCF of 20%.

9c. This item captures other off-balance sheet exposures arising from—

- commitments with an original maturity of over one year; or
- commitments the drawdown of which would give rise to off-balance sheet exposures subject to a CCF of 50%.

10. to 17. Default Risk Exposures (Current Exposure Method): Bilateral Trades – Derivative Contracts (including centrally cleared trades that are treated as bilateral trades)

Reporting AIs that are using the *current exposure method* to calculate the *counterparty default risk* of bilateral trades (including centrally

⁴ This is the length of time between the date the commitment is made and the earliest date on which the reporting AI can, at its option, unconditionally cancel the commitment.

cleared trades that are treated as bilateral trades) arising from derivative contracts should report the trades in these items.

10. ***Exchange rate contracts***

Forward exchange rate contracts arising from swap deposit arrangements are excluded from the calculation of RWA. Under such arrangements, the money deposited by customers is under the control of the reporting AI during the life of the forward contracts, therefore the AI is able to ensure that the customers do not default on the settlement of the forward contracts.

11. Interest rate contracts

12. ***Equity contracts***

13. ***Precious metal contracts***

14. ***Debt security contracts or other commodity contracts***

15. Credit derivative contracts

This item is intended for the reporting of counterparty default risk exposures arising from ***credit default swaps*** and ***total return swaps***.

Credit risk exposure to ***reference entities*** of credit derivative contracts booked in the banking book does not fall within the scope of this item and should be reported in the following manner:

(a) Reporting AI as protection seller

Credit risk exposure to a reference entity of a credit derivative contract is reported as “direct credit substitutes” under item 1 above.

(b) Reporting AI as protection buyer

Credit risk protection provided by a credit derivative contract is either:

- ignored for capital adequacy purposes if the protection is not bought for the purposes of hedging the credit risk of an exposure of the AI or the credit derivative contract is not a ***recognized credit derivative contract***; or
- accounted for in the ways as described in Section C if the protection is bought for the purposes of hedging the

credit risk of an exposure of the AI and the credit derivative contract is a recognized credit derivative contract.

16. Derivative contracts subject to valid bilateral netting agreements

This item refers to the default risk exposure obtained using the methodology set out in section 131 of the BCR (also see the explanation in paragraph 36). For capital adequacy purposes, only default risk exposures of derivative contracts may be reported on a net basis.

17. Other derivative contracts not specified above

This item is for the reporting of default risk exposures in respect of derivative contracts that are not covered by items 10 to 16.

18. Default Risk Exposures (Non-IMM(CCR) Approach): Bilateral Trades – SFTs (including centrally cleared trades that are treated as bilateral trades)

Reporting AIs that are using the methods explained in paragraph 13 to calculate the counterparty default risk of bilateral trades (including centrally cleared trades that are treated as bilateral trades) arising from SFTs should report the trades in this item.

19. to 23. Default Risk Exposures (IMM(CCR) approach): Bilateral Trades (including centrally cleared trades that are treated as bilateral trades)

Reporting AIs that are using the IMM(CCR) approach to calculate the counterparty default risk of bilateral trades (including centrally cleared trades that are treated as bilateral trades) arising from derivative contracts and SFTs should report the trades in these items.

19. Portfolio-level risk-weighted amount based on current market data

The portfolio-level risk-weighted amount calculated under sections 226D(1)(a) and (2)(a) of the BCR should be reported in this item.

20. Portfolio-level risk-weighted amount based on stress calibration

The portfolio-level risk-weighted amount calculated under sections 226D(1)(b) and (2)(b) of the BCR should be reported in this item.

Only the higher of item 19 and item 20 will be used in the calculation of the total RWA for credit risk under the BSC approach.

21. to 23. Breakdown of Portfolio-level Risk-weighted Amount

Items 21 to 23 capture the breakdown of the portfolio-level risk-weighted amount that will be used in the capital adequacy ratio calculation. In other words, if the portfolio-level risk-weighted amount calculated using current market data is larger, the data reported in items 21 to 23 should be those that make up the amount reported in item 19.

21. Netting sets (not subject to recognized netting)

This item captures transactions that are not subject to **recognized netting** or that are required to be treated as a separate **netting set** under section 226J(1) of the BCR. If the reporting AI's **IMM(CCR) approval** covers derivative contracts or SFTs and does not exclude **long settlement transactions**, the AI should report long settlement transactions in item 21a or 21b, depending on the nature of the long settlement transactions concerned. If the AI only uses the IMM(CCR) approach for long settlement transactions but not for other transactions, the AI should report the long settlement transactions in item 21c.

22. Netting sets (subject to valid bilateral netting agreements)

This item captures transactions that are subject to valid bilateral netting agreements and that are not required to be treated as a separate netting set under section 226J(1) of the BCR. The reporting treatment for long settlement transactions mentioned in item 21 above applies to item 22.

23. Netting sets (subject to valid cross-product netting agreements)

This item captures transactions that are subject to valid cross-product netting agreements and that are not required to be treated as a separate netting set under section 226J(1) of the BCR.

24. Other off-balance sheet exposures which are not elsewhere reported

Off-balance sheet exposures other than those included in items 1 to 23 above should be reported in this item, these include the credit exposures to persons holding collateral posted by the reporting AI (other than collateral posted for centrally cleared trades and held by CCPs) in a manner that is not bankruptcy remote from the persons. For other off-balance sheet exposure, the AI should consult the HKMA on the reporting arrangements.

21. CCFs for OTC derivative transactions under the current exposure method

The CCFs applicable to OTC derivative transactions are set out in the following table:

Residual Maturity	Exchange Rate (including gold)	Interest Rate	Equity	Precious Metal	Debt Security or Other Commodity
1 year or less	1.0%	0%	6.0%	7.0%	10.0%
Over 1 year to 5 years	5.0%	0.5%	8.0%	7.0%	12.0%
Over 5 years	7.5%	1.5%	10.0%	8.0%	15.0%

For a contract with multiple exchanges of principal, the CCF to be used should be multiplied by the number of remaining payments under the contract.

For a contract which is structured to settle outstanding exposures on specified payment dates and the terms of the contract are reset so that the market value of the contract is zero on these dates, the residual maturity of the contract should be treated as being equal to the period until the next reset date. If the contract is an interest rate contract where the remaining time to final maturity of the contract is more than one year, the CCF is subject to a floor of 0.5%

22. CCFs for credit derivative contracts booked in the trading book under the current exposure method

The CCFs for calculating the *potential exposure* of single-name credit derivative contracts are as follows:

	Protection buyer	Protection seller
Total Return Swap		
Qualifying reference obligation ⁵	5%	5%
Non-qualifying reference obligation ⁵	10%	10%
Credit Default Swap		
Qualifying reference obligation ⁵	5%	5%*
Non-qualifying reference obligation ⁵	10%	10%*

* The protection seller of a credit default swap is required to calculate potential exposure only when such a swap is subject to close-out upon insolvency of the protection buyer while the reference entity is still solvent. The potential exposure of such swap should be capped at the amount of unpaid premium. The protection seller of any credit default swaps without such a "close-out" clause is not required to calculate potential exposure.

In the case of a *first-to-default credit derivative contract*, the CCF for *non-qualifying reference obligation* should be applied to the contract if there is at least one non-qualifying reference obligation in the basket of reference obligations specified in the contract, otherwise, the CCF for *qualifying reference obligation* should be used. In the case of a *second-to-default credit derivative contract*, the CCF for non-qualifying reference obligation should be applied to the contract if there are at least two non-qualifying reference obligations in the basket of reference obligations specified in the contract, otherwise, the CCF for qualifying reference obligation should be used. The same principle applies to other subsequent-to-default credit derivative contracts.

⁵ The definition of "qualifying" is same as that of the "qualifying" category for the treatment of specific risk under the Standardized (Market Risk) approach described in Part 8 of the BCR and also includes reference obligations issued by sovereigns whose credit quality grades are 1, 2 or 3 as determined in accordance with section 287 of the BCR.

23. CCFs for other derivative contracts under the current exposure method

For OTC derivative transactions and credit derivative contracts that are not mentioned in paragraphs 21 and 22, the applicable CCFs are the same as those applicable to debt security contracts or other commodity contracts.

24. For off-balance sheet items not mentioned above, a CCF of 100% should be applied unless otherwise specified by the MA.

25. For exchange traded derivative contracts that are treated as bilateral trades for risk-weighting purpose, the CCFs applicable to the contracts should be determined as if they were OTC derivative transactions or credit derivative contracts, as the case requires.

26. Default risk exposures of certain credit derivative contracts under the current exposure method and the IMM(CCR) approach

The default risk exposures of credit derivative contracts falling within the following categories can be regarded as zero:

- (a) Credit default swaps that have been reported as “direct credit substitutes” under item 1 in Division B or as securitization exposures in Form MA(BS)3(IIIId) (i.e. the reporting AI has already held capital against the credit risk of the reference obligations underlying the swaps);
- (b) Recognized credit derivative contracts held by the reporting AI as protection buyer in respect of which the CRM effects have already been taken into account in accordance with Divisions 7 and 8 of Part 5 or Division 5 of Part 7 of the BCR for the purposes of RWA calculation.

Determination of Risk-weights for Off-balance Sheet Items

27. Risk-weights for items other than default risk exposures arising from derivative contracts and SFTs (i.e. items 1 to 9 and 24)

The risk-weight of an off-balance sheet item is determined in the same manner as an on-balance sheet exposure except for the following:

- (a) Asset sales with recourse;
- (b) Forward asset purchases;
- (c) Partly paid-up shares and securities; and
- (d) Direct credit substitutes arising from the selling of credit derivative contracts in the form of total return swaps or credit default swaps booked in the reporting AI's banking book.

The risk-weight of an exposure falling within any of the above categories should be determined as:

- (e) in the case of (a) and (b), the risk-weight allocated to the asset sold/to be purchased or the **obligor** of the asset, as the case requires;
- (f) in the case of (c), the risk-weight allocated to the relevant shares or securities; and
- (g) in the case of (d), the risk-weight of the relevant reference obligation of the credit derivative contract. The risk-weights of credit derivative contracts that provide **credit protection** to a basket of exposures should be determined as follows:
 - (i) if the credit derivative contract sold is a first-to-default credit derivative contract, the reporting AI should allocate to the contract a risk-weight which is equal to the sum of the risk-weights of the reference obligations in the basket of reference obligations specified in the contract, subject to a maximum of 1,250%;
 - (ii) if the credit derivative contract sold is a second-to-default credit derivative contract, the AI should allocate to the contract a risk-weight which is equal to the sum of the risk-weights of the reference obligations in the basket of reference obligations specified in the contract, but excluding that reference obligation which carries the lowest risk-weight, subject to a maximum of 1,250%. The same principle, with all necessary modifications, also applies to other subsequent-to-default credit derivative contracts; and
 - (iii) if the credit derivative contract sold provides credit protection proportionately to the reference obligations in the basket specified in the contract, the risk-weight of the AI's exposure arising from the contract (i.e. RW_a) must be calculated by the following formula:

$$RW_a = \sum_i a_i \times RW_i$$

where:

RW_a = Average risk-weight of a basket of reference obligations

a_i = Proportion of credit protection allocated to a reference obligation

RW_i = Risk-weight of a reference obligation

28. Risk-weights for default risk exposures arising from derivative contracts and SFTs (i.e. Items 10 to 23)

The applicable risk-weights are determined by reference to the **attributed risk-weights** allocated to the counterparties of these contracts.

Section C: Calculation and Reporting of Risk-weighted Amount

C.1 On-balance Sheet Exposures

29. For each on-balance sheet exposure, the RWA is calculated by multiplying its principal amount (after deduction of specific provisions) by an appropriate risk-weight determined in accordance with Part 5 of the BCR.

30. If an exposure is not covered by any recognized CRM, the whole principal amount (after deduction of specific provisions) is reported in the “Principal Amount” column of the row for the risk-weight applicable to the exposure. If an exposure is covered fully or partially by recognized CRM, the amount reported in the “Principal Amount” column should be adjusted to reflect the CRM effect as set out below:

(a) **CRM treatment by substitution of risk-weights** (applicable to collateral, guarantees and credit derivative contracts)

(i) Firstly, divide the principal amount (after deduction of specific provisions) of the exposure into two portions: the credit protection covered portion and the credit protection uncovered portion;

(ii) Secondly, report the amount of the credit protection covered portion in the “Principal Amount” column of the row for the class and risk-weight applicable to the credit protection in accordance with the instructions set out in Section B above. That is, the credit protection covered portion should be allocated a risk-weight which is the risk-weight of the collateral, or, in the case of guarantees or credit derivative contracts, the risk-weight of the ***credit protection provider*** (or the CCP if the credit derivative contracts fall within section 134(7));

(iii) Thirdly, report the amount of the credit protection uncovered portion in the “Principal Amount” column of the row for the class and risk-weight applicable to the exposure in accordance with the instructions set out in Section B above; and

(iv) Fourthly, the RWAs of the credit protection covered and uncovered portions are then calculated by multiplying the principal amounts by their applicable risk-weights.

(v) For collateral, the value of credit protection is its market value subject to a minimum revaluation frequency of 6 months. If the collateral is in the form of cash deposits, certificates of deposit or other comparable instruments and it is held at a third-party bank in a non-custodial arrangement and unconditionally and irrevocably pledged or assigned to the reporting AI, the collateral should be allocated the same risk-weight as that of the third-party bank. If there is ***currency mismatch*** between the exposure and the collateral concerned, the value of the collateral should be reduced by a standard ***haircut*** of 8%.

(vi) For guarantees and credit derivative contracts, the value of credit protection is the maximum liability of the credit protection provider to the reporting AI under the credit protection. If there is currency mismatch between the credit protection and the exposure, the value of credit protection should be reduced by a standard haircut of 8%. However, if the credit protection for a basket of exposures consists of a credit derivative contract with the following features, the extent of credit protection should be determined as follows:

- (A) if the contract is a recognized first-to-default credit derivative contract, the AI may recognize that credit protection for the exposure in the basket which would carry the lowest RWA in the absence of the credit protection, provided that the principal amount of the exposure is not more than the ***notional amount*** of the credit derivative contract. The AI may substitute the risk-weight of the credit protection provider (or the CCP concerned where applicable by virtue of section 135(6A) of the BCR) for the risk-weight of that exposure;
- (B) if the contract is a recognized second-to-default credit derivative contract, the AI may substitute the risk-weight of the credit protection provider (or the CCP concerned where applicable by virtue of section 135(6A) of the BCR) for the risk-weight of the exposure in the basket which would carry the second lowest RWA in the absence of the credit protection only if—
 - the AI has, as a protection buyer, entered into a recognized first-to-default credit derivative contract of which the basket of obligations, or the basket of obligations used for the purposes of determining whether a ***credit event*** has occurred, is the same as that of the second-to-default credit derivative contract; or
 - an obligation in the basket referred to in the first bullet above has defaulted;
- (C) if the contract is any other subsequent-to-default credit derivative contract, the same principle as that applied to a second-to-default credit derivative contract, with all necessary modifications, applies;
- (D) if the contract provides credit protection proportionately to the reference obligations in the basket specified in the contract, the AI may substitute the risk-weight of the credit protection provider (or the CCP concerned where applicable by virtue of section 135(6A) of the BCR) for the risk-weights of the exposures to the extent of the amounts protected.

(b) **CRM treatment by reduction of principal amount** (applicable to on-balance sheet netting)

- (i) Firstly, identify the class to which the obligor of the exposures belongs and the risk-weight applicable to that obligor. Then calculate the net principal amount of the exposures and liabilities which are subject to recognized

netting by subtracting the aggregate book value of the liabilities from the aggregate principal amount of the exposures. If there is currency mismatch between the exposures and the liabilities, the aggregate book value of the liabilities should be reduced by a haircut of 8%;

- (ii) Secondly, report this net principal amount in the “Principal Amount” column of the row for the risk-weight applicable to the obligor; and
- (iii) Thirdly, the RWA is calculated by multiplying the “Principal Amount” by the risk-weight of the obligor.

31. Credit protection by means of Credit-linked Notes

If the reporting AI issues a CLN to cover the credit risk of an exposure, the amount of credit protection is the amount of funds received from that note. The amount of the exposure which is covered by the funds is treated as an exposure collateralized by cash deposits.

C.2 Off-balance Sheet Exposures

- 32. For each off-balance sheet exposure, the reporting AI should identify the relevant item in Division B to which the exposure belongs, and report the exposure in the row for that item.
- 33. For the purposes of items 15, 16 and 19 to 23 in Division B, if the derivative contract concerned is a single-name credit default swap that falls within section 226J(1) of the BCR and the default risk exposure in respect of the swap is determined in accordance with section 226J(3) of the BCR, the reporting AI should not take into account any recognized CRM afforded to the swap when calculating the RWA of the swap (see also section 121(6A) of the BCR).

For Items other than Default Risk Exposures arising from Derivative Contracts and SFTs (i.e. items 1 to 9 and 24)

- 34. If an off-balance sheet exposure is not covered by recognized CRM, the process for calculating the RWA is as follows:
 - (a) Firstly, report the whole principal amount (after deduction of specific provisions) of the exposure in the “Principal Amount” column of the row for the item to which the off-balance sheet exposure belongs;
 - (b) Secondly, calculate the CEA of the exposure by multiplying the principal amount (after deduction of specific provisions) by the applicable CCF; and
 - (c) Thirdly, multiply the CEA by the applicable risk-weight to calculate the RWA.
- 35. If an off-balance sheet exposure is covered fully or partially by recognized CRM, the calculation is similar to that of on-balance sheet exposures (see Section C.1), except

that in calculating the RWA, CEA is used instead of principal amount. The following CRM treatment by substitution of risk-weights applies to collateral, guarantees and credit derivatives contracts:

- (a) Firstly, report the whole principal amount (after deduction of specific provisions) of the exposure in the “Principal Amount” column of the row for the item to which the exposure belongs;
- (b) Secondly, divide the principal amount into two portions: the credit protection covered portion and credit protection uncovered portion (the value of the credit protection for different types of recognized CRM is determined in the same way as set out in Section C.1);
- (c) Thirdly, multiply the amount of each of the two portions by the CCF applicable to the exposure to come up with two CEAs and report the sum of the two CEAs in the column of “Credit Equivalent Amount”; and
- (d) Fourthly, multiply the CEA of the credit protection covered portion by the risk-weight attributed to the collateral or credit protection provider (or the CCP concerned where applicable by virtue of section 134(7) or 135(6A) of the BCR) and multiply the CEA of the credit protection uncovered portion by the risk-weight applicable to the exposure to come up with two RWAs. The sum of the two RWAs is reported in the column of “Risk-weighted Amount”.

For Default Risk Exposures arising from Derivative Contracts under the Current Exposure Method (i.e. items 10 to 17)

36. Contracts which are not covered by valid bilateral netting agreements should be reported under items 10 to 15 and 17. For contracts covered by valid bilateral netting agreements, the reporting AI may report them on a net basis under item 16.

(a) Current exposure method

- (i) Firstly, report the principal amount of the contract(s) in the column of “Principal Amount”.
- (ii) Secondly, calculate the CEA which is the sum of the current exposure and the potential exposure as calculated below:

(A) current exposure is—

- a contract’s mark-to-market replacement cost (if the cost is negative or zero, the current exposure should be taken as zero); or
- (if contracts are covered by a valid bilateral netting agreement) the sum of the positive and negative mark-to-market replacement costs of individual contracts (if the sum so obtained is negative or zero, the current exposure should be taken as zero).

(B) potential exposure (i.e. the add-on) is—

- derived by multiplying the principal amount of a contract by the applicable CCF specified in Section B.2; or
- (if contacts are covered by a valid bilateral netting agreement) derived by the formula set out in paragraph (b) below.

If the exposure arising from the contract(s) falls within section 226Z of the BCR, the CEA should be multiplied by the applicable scaling factor.

(iii) Thirdly, deduct specific provisions and **CVA losses**, if any, from the exposure amount calculated under subparagraph (ii) and report the resultant amount in the column of “Credit Equivalent Amount”.

(iv) Finally, multiply the reported “Credit Equivalent Amount” by the risk-weight applicable to the counterparty to calculate the RWA.

(b) Add-on of derivative contracts subject to recognized netting

The net add-on (A_{Net}) of derivative contracts covered by a valid bilateral netting agreement is calculated by using the following formula:

$$A_{\text{Net}} = 0.4 \times A_{\text{Gross}} + 0.6 \times \text{NGR} \times A_{\text{Gross}}$$

where:

A_{Gross} = The sum of the individual add-on amounts derived by multiplying the principal amounts of all of the individual contracts by the applicable CCFs

NGR = The ratio of net replacement cost for all the contracts to gross replacement cost for all the contracts

The NGR in the above formula can be calculated on a per counterparty basis or on an aggregate basis. However, the basis chosen by the reporting AI should be used consistently. An illustration of the calculation of the NGR based on the two calculation bases is given in the **Annex IIIa-A**.

There is no need to calculate the potential exposure of single currency floating/floating interest rate swaps. The current exposure, i.e. replacement cost, of these contracts should be taken as their CEAs.

37. If the (net) exposure to a counterparty is covered fully or partially by recognized CRM, the calculation is similar to that of on-balance sheet exposures (see Section C.1 above), except that in calculating the RWA, CEA is used instead of principal amount:

(a) Firstly, report the principal amount of the contract in the column of “Principal Amount”;

- (b) Secondly, convert the principal amount into a CEA using the current exposure method. If the exposure arising from the contract falls within section 226Z of the BCR, the CEA should be multiplied by the applicable scaling factor;
- (c) Thirdly, deduct specific provisions and CVA losses, if any, from the exposure amount calculated under paragraph (b) and report the resultant amount in the column of “Credit Equivalent Amount”;
- (d) Fourthly, divide the amount reported in the column “Credit Equivalent Amount” into two portions: the credit protection covered portion and the credit protection uncovered portion; and
- (e) Finally, multiply the credit protection uncovered portion by the risk-weight applicable to the counterparty and the credit protection covered portion by the risk-weight applicable to the credit protection to calculate two RWAs. The sum of the two RWAs is reported in the column of “Risk-weighted Amount”.

For SFTs of which the default risk exposures are not calculated by using the IMM(CCR) Approach (i.e. item 18)

38. Reporting AIs should report SFTs as follows:

- (a) Column “Principal amount” – report the aggregate principal amount (after deduction of specific provisions for default risk exposures) of the securities sold or lent, or the money paid or lent, or the securities or money provided as collateral, under the SFTs;
- (b) Column “Risk-weighted amount” – the CRM effect of any recognized CRM afforded to the transactions should be reported in the following manner:
 - (i) For each of the SFTs, divide the principal amount (after deduction of specific provisions for default risk exposures) into two portions: the credit protection covered portion and credit protection uncovered portion;
 - (ii) Multiply the credit protection covered portion by the risk-weight attributed to the collateral (i.e. the securities or money received by the AI under the SFT) and multiply the credit protection uncovered portion by the risk-weight applicable to the counterparty to come up with two RWAs; and
 - (iii) Repeat the two steps above for each of the SFTs and report the sum of the resulting RWAs in the column of “Risk-weighted Amount”.

For Transactions of which the Default Risk Exposures are Calculated by using the IMM(CCR) Approach (items 19 to 23)

39. In items 21a to 23, the amount reported in “Default Risk Exposure” should be net of CVA losses if applicable.

40. In items 21*b* and 22*b*, the “Principal Amount” of SFTs should be the principal amount of the securities sold or lent, or the money paid or lent, or the securities or money provided as collateral, under the SFTs. The default risk exposures in respect of SFTs calculated by using the IMM(CCR) approach should be reported in the column of “Default Risk Exposure”.
41. In the case of long settlement transactions, the principal amount to be reported in the column of “Principal Amount” will be based on the nature of the transactions (i.e. whether the transactions are akin to SFTs or derivative contracts).
42. In the case of items 22*a*, *b* and *c* and 23, the default risk exposures reported should be the netting set level default risk exposures (i.e. after taking into account the effect of recognized netting).

C.3 Multiple Credit Risk Mitigation

43. An exposure covered by two or more forms of recognized CRM (e.g. with both collateral and guarantee partially covering the exposure) should be divided into different portions which respectively represent the proportions of the exposure being covered by each of the forms of the recognized CRM used. The calculation of the RWA of each portion will be done separately. If there is an overlap of coverage between the different forms of recognized CRM used, the reporting AI may select, in respect of the overlapped portion, the form of recognized CRM which will result in the lowest RWA of that overlapped portion of the exposure.
44. If credit protection is obtained for a general banking facility consisting of several types of credit line, the reporting AI may determine how the credit protection should be allocated amongst individual exposures under each of the credit lines.

C.4 Maturity Mismatches

45. If the credit protection provided has a residual maturity which is shorter than the residual maturity of the exposure, the reporting AI must not take into account the CRM effect of that credit protection.

Hong Kong Monetary Authority
March 2018

Example of calculating the Net to Gross Ratio (NGR)

1. The following table illustrates how the NGR is calculated on a per counterparty basis and on an aggregate basis:

Transaction	Counterparty A		Counterparty B		Counterparty C	
	Notional amount	Mark-to-market value	Notional amount	Mark-to-market value	Notional amount	Mark-to-market value
Outstanding contract 1	100	10	50	8	30	-3
Outstanding contract 2	100	-5	50	2	30	1
Gross replacement cost (GR)		10		10		1
Net replacement cost (NR)		5		10		0
NGR (per counterparty)	0.5		1		0	
NGR (aggregate)	$\sum \text{NR} / \sum \text{GR} = 15 / 21 = 0.71$					

2. The gross replacement costs (GR) include only the sums of positive market values, they are therefore, 10, 10 and 1 respectively for counterparties A, B and C. The corresponding net replacement costs (NR) are the non-negative sums of both positive and negative market values, i.e. 5, 10 and 0 for A, B and C respectively. Accordingly, the NGR calculated on a per counterparty basis should be $5/10 = 0.5$, $10/10 = 1$ and $0/1 = 0$ for A, B and C respectively. Based on the per counterparty NGR, the net potential exposure on a per counterparty basis can be calculated using Formula 15 in section 131 of the BCR. The aggregate net potential exposure would be the sum of the per counterparty net potential exposure.
3. If the NGR is calculated on an aggregate basis, it will be the ratio of total net replacement costs to total gross replacement costs, i.e. $15/21 = 0.71$. The aggregate net potential exposure is then calculated by substituting this ratio into Formula 15 for each individual counterparty, i.e. A, B and C.

Completion Instructions

Return of Capital Adequacy Ratio Part IIIb – Risk-weighted Amount for Credit Risk Standardized (Credit Risk) Approach Form MA(BS)3(IIIb)

Introduction

1. Form MA(BS)3(IIIb) of Part III should be completed by each authorized institution (AI) incorporated in Hong Kong using the *standardized (credit risk) approach (STC approach)* to calculate *credit risk* under Part 4 of the Banking (Capital) Rules (BCR).
2. This Form covers the following exposures of a reporting AI:
 - (a) All on-balance sheet exposures and off-balance sheet exposures booked in its *banking book*, except:
 - (i) exposures subject to deduction from the *CET1 capital, additional tier 1 capital* and/or *tier 2 capital* (which should be reported in Form MA(BS)3(II));
 - (ii) *securitization exposures* subject to Part 7 of the BCR (which should be reported in Form MA(BS)3(IIIId)); and
 - (iii) exposures to *central counterparties* (CCPs) subject to Division 4 of Part 6A of the BCR (which should be reported in Form MA(BS)3(IIIe)).
 - (b) All *default risk exposures* to counterparties under *securities financing transactions* (SFTs) (see paragraph 11 below) and *derivative contracts* booked in its *trading book*, except:
 - (i) exposures subject to deduction from the CET1 capital, additional tier 1 capital and/or tier 2 capital; and
 - (ii) exposures to CCPs subject to Division 4 of Part 6A of the BCR (which should be reported in Form MA(BS)3(IIIe)).
 - (c) All credit exposures to persons arising from the persons holding collateral posted by the AI in a manner that is not bankruptcy remote from the persons except:
 - (i) exposures subject to deduction from the CET1 capital, additional tier 1 capital and/or tier 2 capital; and
 - (ii) exposures to CCPs subject to Division 4 of Part 6A of the BCR (which should be reported in Form MA(BS)3(IIIe)).

- (d) If applicable, the AI's market risk positions which are (i) exempted from the requirements of Part 8 of the BCR; and (ii) subject to Part 4 of the BCR as required by section 22(4)(c) of the BCR.
3. This Form and these completion instructions should be read in conjunction with the BCR and the relevant supervisory policy/guidance related to the capital adequacy framework.

Section A: Definitions and Clarification

4. The amounts reported in the column of "Principal Amount" should be net of ***specific provisions*** for all items in Division A and items 1 to 9, 18 and 24 of Division B, but gross of specific provisions for items 10 to 17 and 21 to 23 in Division B. For items 10 to 17 in Division B, specific provisions should be deducted from the ***credit equivalent amount*** (CEA) and the resulting figure should be reported in the column of "Credit Equivalent Amount". For items 21 to 23 in Division B, specific provisions should be deducted from the default risk exposure.
5. "Principal Amount after CRM" means the reported "Principal Amount" adjusted for the capital effect of ***recognized credit risk mitigation*** (CRM). Four types of CRM, viz., collateral, netting, ***guarantees*** and ***credit derivative contracts***, are recognized for the purpose of calculating capital requirement provided that they satisfy the relevant legal and operational requirements set out in –
- (a) in the case of netting, section 2(1) (definition of "***valid bilateral netting agreement***") or section 226B of the BCR, as the case requires;
- (b) in the case of collateral, sections 77, 79 and 80 of the BCR;
- (c) in the case of guarantees, section 98 of the BCR; and
- (d) in the case of credit derivative contracts, section 99 of the BCR.

To avoid doubt, guarantees issued by other offices of the reporting AI are not regarded as recognized CRM. Debt securities which are ***re-securitization exposures*** (whether rated or not) cannot be recognized as collateral (see sections 79(2) and 80(2) of the BCR). See Section C for capital treatment and reporting arrangement.

6. Double counting of exposures arising from the same contract or transaction should be avoided. For example, only the undrawn portion of a loan commitment should be reported as an off-balance sheet exposure under item 9a, b or c of Division B while the actual amount which has been lent out should be reported as an on-balance sheet exposure under the relevant class in Division A. ***Trade-related contingencies***, such as trust receipts and shipping guarantees, to which the exposures have already been reported as letters of credit issued or loans against import bills etc. should not be reported under item 3 of Division B.

7. In certain cases, credit exposures arising from derivative contracts may already be reflected, in part, on the reporting AI's balance sheet. For example, the AI may have recorded **current exposures** to counterparties under exchange rate and interest rate contracts on its balance sheet. To avoid double counting, such exposures should be excluded from on-balance sheet exposures and treated as off-balance sheet exposures for the purposes of this Form.
8. Accruals on an exposure should be classified and risk-weighted in the same way as the exposure. Accruals which cannot be so classified should, with the **prior consent** of the Monetary Authority (MA), be included in Class XI - Other exposures which are not **past due exposures**.
9. For SFTs booked in the reporting AI's banking book, the credit exposures to assets underlying the SFTs should be risk-weighted using the "economic substance" approach as described below and reported in Division A (if the securities are **non-securitization exposures**) or Form MA(BS)3(IIIId) (if the securities are securitization exposures):
 - (a) repos of securities - the securities sold by the reporting AI under the transaction should continue to be treated as assets on the balance sheet of the AI, with **regulatory capital** provided for the credit exposure to the securities (see also section 75(2) of the BCR);
 - (b) reverse repos of securities - if the AI has acquired securities under reverse repo agreements, no regulatory capital is required for the money paid by the AI;
 - (c) securities lending - the treatment is similar to that of repo transactions. The securities lent should continue to remain as assets on the balance sheet of the AI, with regulatory capital provided for the credit exposure to the securities (see also section 75(2) of the BCR); and
 - (d) securities borrowing - if the collateral provided is not cash but securities, the securities should continue to remain as assets on the balance sheet of the AI, with regulatory capital provided for the credit exposure to the securities (see also section 75(4)(b) of the BCR).

If the securities underlying the SFTs are **securitization issues**, the AI should determine the risk-weight attributable to the securities in accordance with Part 7 of the BCR (see also section 75(5) of the BCR) and report the securities in Form MA(BS)3(IIIId) accordingly.

10. For SFTs booked in the reporting AI's trading book, the AI's exposures to the assets underlying the SFTs are market risk exposures. Hence, the AI only needs to calculate the **risk-weighted amounts** (RWAs) of its market risk exposures to the assets in accordance with Part 8 of the BCR (see section 76 of the BCR) and report the exposures in Form MA(BS)3(IV). The AI is not required to calculate any RWA for the credit risk of the assets. However, if the AI is granted an exemption under section 22 of the BCR, the AI should comply with section 75

instead of section 76 in calculating the RWAs of its exposures to the assets, and report the exposures in this Form instead.

11. The default risk exposures in respect of SFTs (regardless of whether they are booked in the banking book or trading book) should be reported in Division B in the following manner:

- (a) Reporting AIs with the MA's approval to use the *internal models (counterparty credit risk) approach (IMM(CCR) approach)* to calculate the default risk exposures in respect of SFTs should report the exposures in items 21 to 23 of Division B (see paragraph 21 for the reporting arrangement) instead of item 18 of Division B.
- (b) Reporting AIs without the MA's approval to use the IMM(CCR) approach (or which are permitted not to use the IMM(CCR) approach) to calculate the default risk exposures in respect of SFTs should calculate the exposures as follows:
 - (i) *repos of securities* - the AI should treat the securities sold as if it were an on-balance sheet exposure to the counterparty concerned secured on the money received by the AI and calculate the *SFT risk-weighted amount* taking into account the CRM effect of the collateral (i.e. the money received) (see also section 76A(4) of the BCR);
 - (ii) *reverse repos of securities* - the transaction should be treated as if it were a collateralized lending to the counterparty concerned and the SFT risk-weighted amount should be calculated with the CRM effect of the collateral (i.e. the securities purchased) taken into account (see also section 76A(5) of the BCR);
 - (iii) *securities lending* – the securities lent should be treated as if it were an on-balance sheet exposure to the counterparty concerned secured on the money or securities received by the AI and the SFT risk-weighted amount should be calculated with the CRM effect of the collateral (i.e. the money or securities received) taken into account (see also section 76A(4) of the BCR);
 - (iv) *securities borrowing* - the transaction should be treated as if it were an on-balance sheet exposure to the counterparty¹ secured on the securities borrowed and the SFT risk-weighted amount should be calculated with the CRM effect of the collateral (i.e. the securities borrowed) taken into account (see also section 76A(7) of the BCR); and
 - (v) *margin lending* - the SFT risk-weighted amount of the transaction should be calculated with the CRM effect of the securities financed by the transaction taken into account (see also section 76A(6) of the BCR).

¹ For securities lending or borrowing where the contractual agreement is made between the securities borrower/lender and the custodian (e.g. Clearstream Banking or Euroclear Bank), and the securities borrower/lender has no knowledge of from/to whom the security is borrowed/lent, the custodian becomes the “counterparty” of the securities borrower/lender.

For the purposes of this paragraph, the collateral must meet the relevant criteria for qualifying as *recognized collateral* under the BCR.

12. An *originating institution* of a *non-eligible securitization transaction* must report the RWA of the *underlying exposures* of the transaction in this Form as if the exposures were not securitized. The underlying exposures of an *eligible synthetic securitization transaction* must be reported in this Form in the same manner as a non-eligible securitization transaction except that the CRM for transferring the credit risk of the underlying exposures to the other parties to the transaction can be taken into account in the RWA calculation and therefore should also be included in the reporting. For cases which are not specified in these instructions or in any other supervisory guidance relevant to securitization transactions, reporting AIs should consult the HKMA on the reporting arrangements.

Section B: Exposure Classification, Determination of Credit Conversion Factors and Risk-weights

B.1 On-balance Sheet Exposures

Exposure Classification

13. Division A of the Form is organized according to the 13 standard classes into which on-balance sheet exposures should be classified under the STC approach:

Class I	- <i>Sovereign</i> exposures
Class II	- <i>Public sector entity</i> exposures
Class III	- Multilateral development bank exposures
Class IV	- <i>Bank</i> exposures
Class V	- <i>Securities firm</i> exposures
Class VI	- <i>Corporate</i> exposures
Class VII	- <i>Collective investment scheme</i> exposures
Class VIII	- <i>Cash items</i>
Class IX	- <i>Regulatory retail exposures</i>
Class X	- <i>Residential mortgage loans</i>
Class XI	- Other exposures which are not past due exposures
Class XII	- Past due exposures
Class XIII	- Exposures subject to 1250% risk-weight

14. The 13 classes are mutually exclusive and therefore each exposure should be reported under only one of them. For instance, an exposure which falls within the definition of “past due exposure” should only be reported under Class XII and not elsewhere.

Determination of Risk-weights

15. The risk-weight for an exposure under any of Classes I, II, IV to VII is determined based on *ECAI ratings* assigned by *external credit assessment*

institutions (ECAIs) recognized by the HKMA. Each of these six ECAI ratings based portfolios has its own risk-weighting framework under which risk-weights are mapped to a scale of **Credit Quality Grades** represented by the numerals 1 to 5 or 1 to 6, as the case may be. The following table sets out the ECAIs recognized by the HKMA and the exposure classes to which ratings issued by these ECAIs can be applied.

ECAI	Applicable Exposure Class
<i>Standard & Poor's Rating Services</i> (S&P) <i>Moody's Investors Service</i> (Moody's) <i>Fitch Ratings</i> (Fitch) <i>Rating and Investment Information, Inc</i> (R&I)	Classes I, II, IV to VII
<i>Japan Credit Agency, Ltd.</i> (JCR)	Classes I, II, IV to VI
<i>ICRA Limited</i> (ICRA) <i>Credit Analysis and Research Limited</i> (CARE) <i>CRISIL Limited</i> (CRISIL)	Class VI – only applicable to exposures to corporates incorporated in India

Schedule 6 to the BCR sets out how, for each portfolio, different sets of notations used by different ECAIs are mapped to the Credit Quality Grades (**Annex IIIb-A** provides a quick reference for the mapping).

16. Reporting AIs should follow a number of general principles when selecting an appropriate ECAI rating for risk-weighting an exposure. These principles are set out in sections 69 and 70 of the BCR (see **Annex IIIb-B** for quick reference).
17. “Issuer rating” referred to in these instructions means an **ECAI issuer rating** assigned to an **obligor**, and “issue specific rating”—
 - (a) in relation to Class I (i.e. Sovereign Exposures), means a **long-term ECAI issue specific rating** assigned to a particular debt obligation of an obligor;
 - (b) in relation to Classes IV, V and VI (i.e. Bank, Securities Firm and Corporate Exposures), means either a long-term or a **short-term ECAI issue specific rating** assigned to a particular debt obligation of an obligor; or
 - (c) in relation to Class VII (i.e. Collective Investment Scheme Exposures), means an **ECAI issue specific rating** assigned to a particular collective investment scheme.
18. The following explains how exposures in each class are risk-weighted and, if applicable, the relevant reporting principles.

<u>Item</u>	<u>Nature of item</u>
-------------	-----------------------

Class I	Sovereign Exposures
----------------	----------------------------

1.	Domestic currency exposures to the Government are risk-
----	--

weighted at 0%. Included are:

- (a) deposits placed with, and loans made to, the Government (including those for the account of the Exchange Fund and the clearing balances with the Exchange Fund);
- (b) holdings of Exchange Fund Bills/Notes. Market makers who have short positions in Exchange Fund Bills/Notes may report their net holdings of such instruments provided that the short positions are covered by the Sale and Repurchase Agreements with the HKMA. The following steps should be taken in determining the amount to be reported:
 - (i) the long and short positions of instruments with a residual maturity of less than 1 year may be offset with each other;
 - (ii) the long and short positions of instruments with a residual maturity of not less than 1 year may be offset with each other;
 - (iii) if the net positions of both (i) and (ii) above are long, the positions should be reported;
 - (iv) if the net position in (i) is long and the net position in (ii) is short, or the other way round, the two positions can be netted with each other on a dollar for dollar basis. The resultant net long position, if any, should be reported.

2. Other exposures to sovereigns include foreign currency exposures to the Government, and all exposures to other sovereigns. For risk-weighting purposes, these exposures should be divided into those with an issue specific rating and those without.

- (a) Exposure with an issue specific rating (i.e. rated exposure)

The issue specific rating should be used to determine the applicable risk-weight of the exposure based on Table 1.

Table 1

Credit Quality Grade of an issuer/issue	1	2	3	4	5	6
Risk-weight (S&P, Moody's, Fitch, R&I & JCR)	0%	20%	50%	100%	100%	150%

- (b) Exposure without an issue specific rating (i.e. unrated exposure)
- (i) If the sovereign has no issuer rating and none of its other debt obligations has an issue specific rating, a 100% risk-weight should be allocated to the exposure.
 - (ii) If the sovereign has an issuer rating and/or any of its other debt obligations has an issue specific rating, the following instructions apply:
 - (A) If the sovereign has an issuer rating, the risk-weight which is applicable to that rating based on Table 1 should be allocated to the exposure. However, if the applicable risk-weight is lower than 100%, the exposure should be senior (i.e. unsubordinated) in order for the lower risk-weight to apply. If the applicable risk-weight is equal to or higher than 100%, the reporting AI is required to allocate the applicable risk-weight to the exposure only if the exposure ranks pari passu with, or is subordinate to, senior unsecured debt obligations of the issuer (see section 69(4) of the BCR).
 - (B) If any of the other debt obligations of the sovereign has an issue specific rating, the risk-weight which is applicable to that rating based on Table 1 should be allocated to the exposure. However, if the applicable risk-weight is lower than 100%, the exposure should rank pari passu with, or should be senior to, the rated debt obligation in all respects in order for the lower risk-weight to apply. If the applicable risk-weight is equal to or higher than 100%, the AI is required to allocate the applicable risk-weight to the exposure only if the exposure ranks pari passu with, or is subordinate to, the rated debt obligation (see section 69(3) of the BCR).
 - (C) If both (A) and (B) above apply, the AI will have the discretion to choose which one to allocate to the exposure.
- (c) Despite (a) and (b) above, if an overseas banking supervisory authority exercises its discretion under Basel II to permit banks in its jurisdiction to allocate a lower risk-weight to domestic currency exposures to its sovereign, the AI may allocate the same lower risk-weight to its domestic currency exposure to that sovereign.

3. ***Relevant international organization*** exposures are risk-weighted at 0%.

Class II Public Sector Entity (PSE) Exposures

4. Exposures to ***domestic PSEs*** should be allocated a risk-weight which is the next higher risk-weight than the risk-weight attributable to the credit quality grade applicable to the issuer rating of the Government, with the following exceptions should any of these become applicable in the future:
- (a) If the issuer rating of the Government is mapped to credit quality grade 4 or 5 (i.e. allocated a 100% risk-weight), exposures to domestic PSEs should be allocated a 100% risk-weight;
 - (b) If the issuer rating of the Government is mapped to credit quality grade 6 (i.e. allocated a 150% risk-weight), exposures to domestic PSEs should be allocated a 150% risk-weight; or
 - (c) If no issuer rating is assigned to the Government, exposures to domestic PSEs should be allocated a 100% risk-weight.
5. Exposures to ***foreign PSEs*** should be allocated a risk-weight which is the next higher risk-weight than the risk-weight attributable to the credit quality grade applicable to the issuer rating of the sovereign of the jurisdiction in which the PSEs are ***incorporated***, with the following exceptions:
- (a) Exposures to ***sovereign foreign PSEs*** should be allocated a risk-weight which is the risk-weight applicable to the issuer rating of the sovereign of the jurisdiction in which the PSEs are incorporated;
 - (b) If the issuer rating of the sovereign of the jurisdiction in which a foreign PSE is incorporated is mapped to credit quality grade 4 or 5 (i.e. allocated a 100% risk-weight), exposures to the PSE should be allocated a 100% risk-weight;
 - (c) If the issuer rating of the sovereign of the jurisdiction in which a foreign PSE is incorporated is mapped to credit quality grade 6 (i.e. allocated a 150% risk-weight), exposures to the PSE should be allocated a 150% risk-weight; or
 - (d) If no issuer rating is assigned to a sovereign, exposures to its PSEs should be risk-weighted at 100%.

Class III Multilateral Development Bank (MDB) Exposures

6. MDB exposures are risk-weighted at 0%.

Class IV Bank Exposures

- 7a. & b. Bank exposures should be divided into those with an original contractual period of time for full repayment (i.e. original maturity) of 3 months or less (**3 months' exposures**) and those with an original maturity longer than 3 months (**general exposures**).

Exposures within each of the two categories should then be divided into those with an issue specific rating and those without.

- (a) Exposure with an issue specific rating (i.e. rated exposure)

The issue specific rating should be used to determine the applicable risk-weight of the exposure based on Table 2A or 2B, as the case requires, if it is a long-term issue specific rating, or based on Table 3 if it is a short-term issue specific rating.

Table 2A - General exposures

Credit Quality Grade of an issuer/issue	1	2	3	4	5
Risk-weight (S&P, Moody's, Fitch, R&I & JCR)	20%	50%	50%	100%	150%

Table 2B - 3 months' exposures

Credit Quality Grade of an issuer/issue	1	2	3	4	5
Risk-weight (S&P, Moody's, Fitch, R&I & JCR)	20%	20%	20%	50%	150%

Table 3

Short-term Credit Quality Grade of an issue	1	2	3	4
Risk-weight (S&P, Moody's, Fitch, R&I & JCR)	20%	50%	100%	150%

Notwithstanding the above, a rated 3 months' exposure denominated and funded in Hong Kong dollars may be allocated a risk-weight of 20%.

(b) Exposure without an issue specific rating (i.e. unrated exposure)

(i) If the bank has no issuer rating and none of its other debt obligations has been assigned an issue specific rating, the risk-weight to be allocated should be 50% for a general exposure and 20% for a 3 months' exposure. However, the risk-weight to be allocated will be –

(A) the risk-weight applicable to the sovereign of incorporation of the bank instead if such risk-weight is higher than 50% (in the case of general exposures) or 20% (in the case of 3 months' exposures); or

(B) 100% if the sovereign does not have an issuer rating.

The sovereign floor mentioned in (i) above does not apply to bank exposures arising from confirmed letters of credit that have a maturity of less than one year (see section 59(5A) of the BCR).

(ii) If the bank has an issuer rating and/or any of its other debt obligations has an issue specific rating, the risk-weight of the exposure should be determined as follows:

(A) *Unrated general exposure*

(I) If the bank has an issuer rating and/or any of its other debt obligations has a long-term issue specific rating, the reporting AI may, at its choice, determine the risk-weight to be allocated to the exposure according to either approach set out below:

- If the bank has an issuer rating, the risk-weight which is applicable to that rating based on Table 2A should be applied to the exposure. However, if the applicable risk-weight is lower than 50%, the exposure should be senior (i.e. unsubordinated) for the lower risk-weight to apply. If the applicable risk-weight is equal to or higher than 50%, the AI is required to allocate the applicable risk-weight to the exposure only if the exposure ranks *pari passu*

with, or is subordinate to, senior unsecured debt obligations of the issuer (see section 69(4) of the BCR); or

- If any of the other debt obligations of the bank has a long-term issue specific rating, the risk-weight which is applicable to that rating based on Table 2A should be applied to the exposure. However, if the applicable risk-weight is lower than the 50%, the exposure should rank pari passu with, or should be senior to, the rated debt obligation in all respects for the lower risk-weight to apply. If the applicable risk-weight is equal to or higher than 50%, the AI is required to allocate the applicable risk-weight to the exposure only if the exposure ranks pari passu with, or is subordinate to, the rated debt obligation (see section 69(3) of the BCR).

(II) If any of the other debt obligations of the bank has a short-term issue specific rating, but the bank does not have an issuer rating, and none of its other debt obligations has a long-term issue specific rating, the risk-weight applicable to the exposure should be determined according to (i) above.

(B) *Unrated 3 months' exposures*

(I) If none of the other debt obligations of the bank has a short-term issue specific rating, but the bank has an issuer rating and/or any of its other debt obligations has a long-term issue specific rating, the risk-weight which should be applied to the exposure will be, at the choice of the reporting AI, either:

- the risk-weight applicable to the issuer rating of the bank as determined based on Table 2B; or
- the risk-weight applicable to the long-term issue specific rating of any of its other debt obligations as determined based on Table 2B.

(II) If any of the other debt obligations of the

bank has a short-term issue specific rating, but the bank does not have an issuer rating, and none of its other debt obligations has a long-term issue specific rating, the risk-weight which should be applied to the exposure will be the higher of—

- 20%; and
- the risk-weight applicable to the short-term issue specific rating as determined based on Table 3.

(III) If both (1) the bank has an issuer rating and/or any of its other debt obligations has a long-term issue specific rating, and (2) another debt obligation of the bank has a short-term issue specific rating, the risk-weight which should be applied to the exposure will be the higher of—

- the risk-weight as determined in accordance with Table 2B based on either the issuer rating or the long-term issue specific rating at the choice of the reporting AI if the two risk-weights are different; and
- the risk-weight applicable to the short-term issue specific rating as determined based on Table 3.

(iii) Exceptions to the above

(A) Notwithstanding (ii)(A)(I) to (ii)(B)(III), the risk-weight of the exposure should be adjusted to 150% if any of the other debt obligations of the bank has a short-term issue specific rating which maps to a 150% risk-weight based on Table 3.

(B) Notwithstanding (ii)(B)(I) to (iii)(A), a 3 months' exposure denominated and funded in Hong Kong dollars may be allocated a risk-weight of 20%.

For the purposes of this class, **clean²** export trade bills negotiated under other banks' letters of credit may be reported as exposures to the issuing banks of the letters of credit.

² This includes cases where discrepancies have been accepted by the issuing bank concerned.

Class V Securities Firm Exposures

8. Exposures should be divided into those with an issue specific rating and those without.

(a) Exposure with an issue specific rating (i.e. rated exposure)

The issue specific rating should be used to determine the risk-weight of the exposure based on the following two tables, viz., Table 4 if it is a long-term issue specific rating and Table 5 if it is a short-term issue specific rating.

Table 4

Credit Quality Grade of an issuer/issue	1	2	3	4	5
Risk-weight (S&P, Moody's, Fitch, R&I & JCR)	20%	50%	50%	100%	150%

Table 5

Short-term Credit Quality Grade for an issue	1	2	3	4
Risk-weight (S&P, Moody's, Fitch, R&I & JCR)	20%	50%	100%	150%

(b) Exposure without an issue specific rating (i.e. unrated exposure)

- (i) An unrated exposure to a securities firm should be allocated a 50% risk-weight if the securities firm –

(A) has no issuer rating and none of its other debt obligations has any issue specific rating; or

(B) has no issuer rating and none of its other debt obligations has a long-term issue specific rating, although at least one of its other debt obligations has a short-term issue specific rating.

However, the risk-weight to be allocated will be –

(C) the risk-weight applicable to the sovereign of incorporation of the firm instead if such risk-weight is higher than 50%; or

(D) 100% if the sovereign does not have an issuer rating.

(ii) If the securities firm has an issuer rating and/or any of its other debt obligations has a long-term issue specific rating, the risk-weight of the exposure should be determined as follows:

(A) If the firm has an issuer rating, the risk-weight which is applicable to that rating based on Table 4 should be allocated to the exposure. However, if the applicable risk-weight is lower than 50%, the exposure should be senior (i.e. unsubordinated) for the lower risk-weight to apply. If the applicable risk-weight is equal to or higher than 50%, the reporting AI is required to allocate the applicable risk-weight to the exposure only if the exposure ranks pari passu with, or is subordinate to, senior unsecured debt obligations of the issuer (see section 69(4) of the BCR).

(B) If any of the other debt obligations of the firm has a long-term issue specific rating, the risk-weight which is applicable to that rating based on Table 4 should be allocated to the exposure. However, if the applicable risk-weight is lower than 50%, the exposure should rank pari passu with, or should be senior to, the rated debt obligation in all respects for the lower risk-weight to apply. If the applicable risk-weight is equal to or higher than 50%, the AI is required to allocate the applicable risk-weight to the exposure only if the exposure ranks pari passu with, or is subordinate to, the rated debt obligation (see section 69(3) of the BCR).

(C) If both (A) and (B) above apply, the AI will have the discretion to choose which one to allocate to the exposure.

(iii) Exceptions to the above

(A) Notwithstanding (i)(B) above, if any of the other debt obligations of the firm (i.e. the reference debt) has a short-term issue specific rating which maps to a risk-weight of 50% or 100% based on Table 5, and the exposure has a residual maturity equal to, or shorter than, the original maturity of the reference debt, the risk-weight to be allocated to the exposure should be 100%. If the firm has two or more debt obligations which attract a risk-weight of 50% or 100%, the one with the longest

original maturity should be taken as the reference debt.

(B) Notwithstanding (ii) above, if any of the other debt obligations of the firm (i.e. the reference debt) has a short-term issue specific rating which maps to a risk-weight of 50% or 100% based on Table 5, and the exposure has a residual maturity equal to, or shorter than, the original maturity of the reference debt, the risk-weight to be allocated to the exposure should be the higher of 100% and the risk-weight derived from (ii) above. If the firm has two or more debt obligations which attract a risk-weight of 50% or 100%, the one with the longest original maturity should be taken as the reference debt.

(C) Notwithstanding (i)(B) to (iii)(B) above, the risk-weight of the exposure should be adjusted to 150% if any of the other debt obligations of the firm has a short-term issue specific rating which maps to a 150% risk-weight based on Table 5.

Class VI Corporate Exposures

9a. to e. Exposures³ should be divided into those with an issue specific rating and those without.

(a) Exposure with an issue specific rating (i.e. rated exposure)

The issue specific rating should be used to determine the risk-weight of the exposure based on the following tables, viz., Table 6A or 6B if it is a long-term issue specific rating and Table 7A or 7B if it is a short-term issue specific rating. In the case of an exposure to a corporate incorporated in India, the issue specific rating can be a rating issued by any ECAI (i.e. Tables 6A, 6B, 7A and 7B are applicable). In the case of an exposure to a corporate incorporated outside India, the rating must be issued by S&P, Moody's, Fitch, R&I or JCR (i.e. only Tables 6A and 7A are applicable).

³ For the avoidance of doubt, corporate exposures include exposures to regional, provincial or municipal governments.

Table 6A

Credit Quality Grade of an issuer/issue	1	2	3	4	5
Risk-weight ((S&P, Moody's, Fitch, R&I & JCR))	20%	50%	100%	100%	150%

Table 6B

Credit Quality Grade of an issuer/issue	1	2	3	4	5
Risk-weight (ICRA, CARE & CRISIL)	20%	30%	50%	100%	150%

Table 7A

Short-term Credit Quality Grade for an issue	1	2	3	4
Risk-weight (S&P, Moody's, Fitch, R&I & JCR)	20%	50%	100%	150%

Table 7B

Short-term Credit Quality Grade for an issue	1	2	3	4	5
Risk-weight (ICRA, CARE & CRISIL)	20%	30%	50%	100%	150%

(b) Exposure without an issue specific rating (i.e. unrated exposure)

- (i) Exposures to corporates incorporated outside India which do not have an issue specific rating assigned by S&P, Moody's, Fitch, R&I or JCR are treated as unrated exposures for risk-weighting purposes.
- (ii) If the corporate concerned is incorporated outside India, the ratings referred to in (iii), (iv) and (v) below should be confined to ratings issued by any of S&P, Moody's, Fitch, R&I and JCR.
- (iii) Subject to (i) and (ii) above, an unrated exposure to a corporate should be assigned a 100% risk-weight if the corporate -
 - (A) has no issuer rating and none of its other debt obligations has an issue specific rating; or
 - (B) has no issuer rating and none of its other debt obligations has a long-term issue specific rating, although at least one of its other debt obligations

has a short-term issue specific rating.

However, the risk-weight to be assigned will be –

- (C) the risk-weight applicable to the sovereign of incorporation of the corporate instead if such risk-weight is higher than 100%; or
 - (D) 100% if the sovereign does not have an issuer rating.
- (iv) Subject to (i) and (ii) above, if the corporate has an issuer rating and/or any of its other debt obligations has a long-term issue specific rating, the risk-weight of the exposure should be determined as follows:
- (A) If the corporate has an issuer rating, the risk-weight which is applicable to that rating based on Table 6A or 6B, as the case requires, should be allocated to the exposure. However, if the applicable risk-weight is lower than 100%, the exposure should be senior (i.e. unsubordinated) for the lower risk-weight to apply. If the applicable risk-weight is equal to or higher than 100%, the reporting AI is required to allocate the applicable risk-weight to the exposure only if the exposure ranks pari passu with, or is subordinate to, senior unsecured debt obligations of the issuer (see section 69(4) of the BCR).
 - (B) If any of the other debt obligations of the corporate has a long-term issue specific rating, the risk-weight which is applicable to that rating based on Table 6A or 6B, as the case requires, should be allocated to the exposure. However, if the applicable risk-weight is lower than 100%, the exposure should rank pari passu with, or should be senior to, the rated debt obligation in all respects for the lower risk-weight to apply. If the applicable risk-weight is equal to or higher than 100%, the AI is required to allocate the applicable risk-weight to the exposure only if the exposure ranks pari passu with, or is subordinate to, the rated debt obligation (see section 69(3) of the BCR).
 - (C) If both (A) and (B) above apply, the AI will have the discretion to choose which one to allocate to the exposure.

(v) Exceptions to the above

(A) Notwithstanding (iv) above, if any of the other debt obligations of the corporate (i.e. the reference debt) has a short-term issue specific rating which maps to a risk-weight of 50% or 100% based on Table 7A or 7B, as the case requires, and the exposure has a residual maturity equal to, or shorter than, the original maturity of the reference debt, the risk-weight to be allocated to the exposure should be the higher of 100% and the risk-weight derived from (iv) above. If the corporate has two or more debt obligations which attract a risk-weight of 50% or 100%, the one with the longest original maturity should be taken as the reference debt.

(B) Notwithstanding (iii)(B) to (v)(A) above, the risk-weight of a exposure should be adjusted to 150% if any of the other debt obligations of the corporate has a short-term issue specific rating which maps to a 150% risk-weight based on Table 7A or 7B, as the case requires.

Class VII Collective Investment Scheme (CIS) Exposures

10a. to d. Holding of shares or units in a CIS which has been assigned with an issue specific rating should be allocated a risk-weight based on Table 8.

Table 8

Credit Quality Grade of a CIS	1	2	3	4	5
Risk-weight (S&P, Moody's, Fitch & R&I)	20%	50%	100%	100%	150%

If no issue specific rating is assigned to a CIS, the risk-weight allocated to the units or shares in the CIS held by the reporting AI should be 100%.

Holdings in a CIS which invests in assets other than cash and fixed income assets should be risk-weighted at 100% and reported under item *10c*.

Class VIII Cash Items

11. Notes and coins are allocated a risk-weight of 0%.

12. Government certificates of indebtedness are allocated a risk-

weight of 0%.

13. Gold bullion held by the reporting AI or held by another person for the AI on an allocated basis, to the extent backed by gold bullion liabilities, is risk-weighted at 0%. Gold bullion held in safe custody for other entities or customers, to which the AI has no credit exposure, is not required to be included in this Form

Gold bullion held for the AI on an unallocated basis by a third party, though backed by gold liabilities, should be risk-weighted as an exposure to that third party and reported under the class to which the third party belongs.

14. Gold bullion held not backed by gold liabilities, which refers to all other holdings of gold bullion not included in item 13 above, is risk-weighted at 100%.

15. Cash items in the course of collection refer to the amount of cheques, drafts and other items drawn on other banks which are payable to the account of the reporting AI immediately upon presentation and which are in the process of collection. Such items are allocated a risk-weight of 20%. Included are cheques and drafts against which the AI has paid to its customers (i.e. by purchasing or discounting the cheques or drafts presented by the customers) and in respect of which it now seeks payment from the drawee banks.

Import and export trade bills held by the AI which are in the process of collection should not be included in this item. They should be reported as exposures to the counterparty concerned and allocated a risk-weight applicable to the counterparty.

Unsettled clearing items under the interbank clearing system in Hong Kong, and receivables arising from transactions in securities (other than *repo-style transactions*), foreign exchange, and *commodities* which are not yet due for settlement should be excluded.

- 16a. to e. Failed trade - delivery-versus-payment (DvP) basis

For any transaction in securities (other than repo-style transactions), foreign exchange, and commodities entered into on a *delivery-versus-payment (DvP) basis*⁴ where payment / delivery has not yet taken place after the settlement date, the reporting AI should report the *positive current exposure* of the transaction in both the column of “Principal Amount” and the column of “Principal Amount after CRM”. The RWA of the transaction is calculated by multiplying the positive current exposure of the

⁴ DvP transactions include payment-versus-payment (PvP) transactions

transaction by the risk-weight corresponding to the length of the period of unsettlement (both the start and end days of the period inclusive).

Failed trade - non-DvP basis

When such transaction is entered into on a non-DvP basis and payment / delivery from the counterparty has not yet taken place up to and including the fourth **business day** after the settlement date, the amount of the payment made or the current market value of the thing delivered by the AI, plus any positive current exposure associated with the transaction, should be treated as an exposure to that counterparty. The amount of the exposure should be reported under the class to which the counterparty belongs and risk-weighted at the risk-weight applicable to that counterparty.

When payment / delivery under any of the above non-DvP transactions has not yet taken place for five or more business days after the settlement date, the AI should report the exposure in item 22c.

17a. to c. These items are for reporting AIs which have adopted the **simple approach** for CRM treatment of collateral (see Section C) to report exposures collateralized by cash deposits (including certificates of deposits and comparable instruments issued by the reporting AIs). The amount of exposures secured by cash deposits should be reported in the column of “Principal Amount after CRM” along the corresponding risk-weight applicable to the cash deposits:

- if there is no **currency mismatch** between the cash deposits and the exposures, the cash deposits are risk-weighted at 0%;
- if there is currency mismatch between the cash deposits and the exposures, the cash deposits are risk-weighted at 20%; and
- if the exposures secured by the cash deposits are repo-style transactions which satisfy the requirements set out in section 82(2)(b) to (h) of the BCR (see paragraphs D3 to D10 of **Annex IIIb-D** for quick reference), the cash deposits are risk-weight at 10%.

When the cash deposit pledged to the AI is held at a third-party bank in a non-custodial arrangement, the AI should treat the cash deposit as an exposure to that third-party bank. The amount secured by that deposit should be reported under Class IV in the column of “Principal Amount after CRM” and allocated the risk-weight applicable to that third-party bank.

Class IX Regulatory Retail Exposures

18a. & b. Exposures to ***small businesses*** or individuals which satisfy the relevant criteria set out in section 64 of the BCR are allocated a risk-weight of 75%.

If the regulatory retail exposures to a borrower include a residential mortgage loan (RML) which is eligible for a risk-weight of 75% according to section 65(4)(a) of the BCR, the RML should be reported under item *19b* of Class X – Residential Mortgage Loans.

Exposures to small businesses or individuals which are not past due exposures and which do not satisfy the criteria for inclusion as regulatory retail exposures or residential mortgage loans (see Class X) should be reported as either corporate exposures (see Class VI) or other exposures which are not past due exposures (see Class XI), as the case requires.

Class X Residential Mortgage Loans

19. RMLs which are not past due exposures should be reported under this item. The following RMLs should also be included:

- (A) RMLs granted for the purchase of flats under the Home Ownership Scheme, Private Sector Participation Scheme, Tenants Purchase Scheme and other similar schemes which are covered by guarantees issued by the Housing Authority;
- (B) Reverse mortgage loans granted under the Reverse Mortgage Programme of The Hong Kong Mortgage Corporation Limited (or its subsidiary); and
- (C) RMLs granted under Mortgage Insurance Programmes of The Hong Kong Mortgage Corporation Limited (or its subsidiary).

19a. 35% risk-weight

RMLs which satisfy the relevant criteria set out in section 65(1) of the BCR are eligible for a risk-weight of 35%.

19b. 75% risk-weight

RMLs which are not eligible for the risk-weight of 35% can be allocated a risk-weight of 75% when they can satisfy the criteria set out in section 65(4)(a) of the BCR.

19c. 100% risk-weight

Other RMLs (i.e. those which do not satisfy sections 65(1) and 65(4)(a) of the BCR) which are not past due exposures should be allocated a risk-weight of 100%.

19d. If the reporting AI has opted to risk-weight those RMLs which are secured by a first legal charge on residential properties situated outside Hong Kong according to the regulatory capital rules of the jurisdictions in which the properties are situated, the RMLs should be reported under this item if the applicable risk-weights are other than 35%, 75% and 100%. RMLs which are risk-weighted at 35%, 75% or 100% according to those jurisdictions' regulatory capital rules should be reported under item 19a, 19b or 19c, whichever is applicable.

For (A) to (C) above, the reporting arrangements are as follows:

- (D) The **principal amount** of those RMLs should be reported under item 19a, 19b or 19c, depending on whether they can, after applying section 65(6) of the BCR in respect of the guarantees or insurances concerned, meet the respective conditions for being so risk-weighted.
- (E) For (A), the CRM effect of the guarantees can be taken into account and reported according to paragraph 31(a) of Section C, while in the case of (B) and (C), the insured portion of the RMLs can be treated as guaranteed exposures and reported according to paragraph 31(a) of Section C if the insurance concerned meets all the criteria set out in section 98 of the BCR.

Class XI Other Exposures which are not Past Due Exposures

Included in this class are all on-balance sheet exposures (i) which are subject to credit risk capital requirements; (ii) which are not past due exposures or exposures that are subject to 1250% risk-weight; and (iii) which have not been included elsewhere in this Form. Exposures included in this class are subject to a risk-weight of 100%, unless otherwise specified in the BCR or by the MA. Examples of exposures to be included in this class are:

20a. Exposures to individuals not elsewhere reported

This item refers to exposures to individuals which have not been included in Class X – Residential Mortgage Loans and do not satisfy the qualifying criteria for inclusion in Class IX - Regulatory Retail Exposures.

20b. Investments in equity or other capital instruments issued by financial sector entities (other than those subject to capital deduction or 250% risk-weight)

Included are investments in equity or other capital instruments (whether rated or unrated) issued by *financial sector entities* which are not subject to capital deduction or 250% risk-weight (see section 66 of the BCR).

20c. Investments in equity of other entities (other than those subject to 1250% risk-weight)

Included are investments in *commercial entities* which are not subject to 1250% risk-weight (see sections 66 and 68A of the BCR).

20d. Premises, plant and equipment, other fixed assets for own use, and other interest in land

Included are investments in premises, plant and equipment and all other fixed assets of the reporting AI which are held for own use. Fixed asset which is held by the AI as lessee under a finance lease in accordance with the Hong Kong Accounting Standards 17 issued by Hong Kong Institute of Certified Public Accountants is also included.

Other interests in land which are not occupied by the AI or used in the operation of the AI's business should also be reported here.

20e. Investments in capital instruments issued by financial sector entities (other than those subject to capital deduction)

Included are investments in equity or other capital instruments (whether rated or unrated) issued by financial sector entities which are subject to 250% risk-weight under section 66(2)(b) of the BCR.

20f. Multiple-name credit-linked notes

This item refers to multiple-name *credit-linked notes* (CLN) (e.g. first-to-default CLN) for which the applicable risk-weights are determined according to **section 68(e)** of the BCR (see **paragraph 19(c)** for explanation).

20g. Other on-balance sheet exposures which are not elsewhere reported

This item refers to other investments or exposures which are subject to credit risk capital requirements and have not been reported in Classes I to X, XI (item 20a to 20f), XII and XIII, and

may include any fixed asset leased by the reporting AI under an operating lease.

This item also includes *credit protection covered portions* of the following exposures:

- (a) Exposures that are secured by recognized collateral –
 - (i) for which the applicable risk-weights are determined under **Part 7 of the BCR**; and
 - (ii) of which the CRM effect is calculated by using the simple approach.
- (b) Exposures that are covered by credit derivative contracts eligible for a risk-weight of 2% or 4% under section 100(10) or 101(6A) of the BCR (The credit protection covered portions should be reported as a separate item from the credit protection covered portions arising from other types of CRM. To avoid doubt, if section 72(f)(ii) or 226I(b) of the BCR applies to the credit derivative contracts concerned, the default risk exposures in respect of the contracts are regarded as zero for the purposes of Form MA(BS)3(IIIe).).

If necessary, the MA may specify a risk-weight which is greater than 100% for an exposure falling within this class. Such exposure should be reported under this item.

Class XII Past Due Exposures

- 21a. to i. A risk-weight of 150% is allocated to the unsecured portion of a past due exposure which is determined by deducting from the gross outstanding amount of the exposure the amount of any specific provisions made in respect of the exposure and the value of any *credit protection* provided to the exposure.

Class XIII Exposures subject to 1250% risk-weight

Report here the following types of on-balance sheet exposure which are subject to a risk-weight of 1250%.

22a. First loss portion of credit protection

This item refers to the first loss portion mentioned in section 101(2) and (8) of the BCR.

22b. Significant exposures to commercial entities

This item refers to the reporting AI's holdings of shares in commercial entities that exceed the threshold set out in section

68A of the BCR.

22c. Non-DvP transactions remain unsettled for 5 or more business days

This item refers to the amount of payment made or the current market value of things delivered by the reporting AI, plus any positive current exposure, in respect of securities (other than repo-style transactions), foreign exchange and commodities transactions entered into on a basis other than a DvP basis, where the payment or deliverables from the counterparty remain unsettled after the contractual settlement date for 5 or more business days (see also section 63A of the BCR).

19. Risk-weights for Credit-linked Notes held

- (a) The risk-weight of a rated, single-name CLN held by the reporting AI should be determined based on the issue specific rating assigned to the CLN. The CLN should be allocated a risk-weight which is the greater of—
 - (i) the risk-weight attributable to the CLN based on the scale of credit quality grades applicable to the issuer of the note; and
 - (ii) the risk-weight attributable to the CLN based on the scale of credit quality grades applicable to the *reference entity*.

If there is not available a scale of credit quality grades applicable to the issue specific rating of the CLN (e.g. the rating is issued by an Indian ECAI but neither the issuer nor the reference entity is a corporate incorporated in India), the AI should treat the CLN as unrated and determine the applicable risk-weight in accordance with paragraph (b) below.

- (b) An unrated, single-name CLN should be allocated a risk-weight which is the higher of the risk-weight of the *reference obligation* of the note and the risk-weight of the note issuer. The amount of the exposure, which is the book value of the note, should be reported under the relevant class in Division A.
- (c) If the note is a multiple-name CLN (whether having an issue specific rating or not), the AI should determine the risk-weight of the basket of reference obligations in accordance with section 68(e) of the BCR. The CLN should be reported in Division A under the class applicable to the issuer of the note if the risk-weight of the issuer is assigned to the CLN, otherwise, the CLN should be reported under Class XI item 20f in that Division.

B.2 Off-balance Sheet Exposures

Classification and Determination of Credit Conversion Factors

20. The reporting AI should classify each of its off-balance sheet exposures into the appropriate standard items listed below and report the ***principal amount*** and the RWA of each exposure based on the instructions set out in Section C.
21. ***Credit conversion factors*** (CCFs) for items 1 to 9 are set out in section 71(1) of the BCR. CCFs for items 10 to 17 and 24 are set out in sections 71(2) and 73 of the BCR respectively (also see paragraphs 22 to 26 for explanation).

<u>Item</u>	<u>Nature of item</u>
-------------	-----------------------

1.	<i>Direct credit substitutes</i>
----	---

2.	<i>Transaction-related contingencies</i>
----	---

3.	Trade-related contingencies
----	-----------------------------

4.	<i>Asset sales with recourse</i>
----	---

5.	<i>Forward asset purchases</i>
----	---------------------------------------

6.	<i>Partly paid-up shares and securities</i>
----	--

7.	<i>Forward forward deposits placed</i>
----	---

This item refers to a commitment to place a forward forward deposit. If the reporting AI has contracted to receive a forward forward deposit, failure to deliver by the counterparty will result in an unanticipated change in the AI's interest rate exposure and may involve a replacement cost. Such exposure should be accorded the same treatment as ***interest rate contracts*** and reported under item 11.

8.	<i>Note issuance and revolving underwriting facilities</i>
----	---

9a. to c.	Other commitments
-----------	-------------------

Included is the undrawn portion of any binding arrangements which obligate the reporting AI to provide funds or to incur off-balance sheet exposures (e.g. commitment to issue letters of credit or performance bonds) at some future dates. The latter does not include commitments to enter into OTC derivative transactions / credit derivative contracts.

A commitment is regarded as being created no later than the acceptance in writing by the customer of the facility offered.

In the case of an off-balance sheet exposure (exposure A) arising from a commitment the drawdown of which will give rise to another off-balance sheet exposure (exposure B) falling within any of items 1 to 8 and 24, the CCF applicable to exposure A should be the lower of—

- the CCF applicable to exposure A based on the original maturity⁵ of the commitment and whether it can be cancelled at any time unconditionally; and
- the CCF applicable to exposure B.

If the commitment is in the form of a general banking facility consisting of 2 or more credit lines (including lines for entering into OTC derivative transactions / credit derivative contracts), the AI should assign a CCF to exposure A based on the original maturity of the commitment and whether the commitment can be unconditionally cancelled at any time.

9a. This item includes off-balance sheet exposures arising from commitments which are unconditionally cancellable without prior notice by the reporting AI other than for “force majeure” reason, or which effectively provide for automatic cancellation due to deterioration in a borrower’s creditworthiness. This also includes any revolving or undated/open-ended commitments, e.g. overdrafts or unused credit card lines, provided that they can be unconditionally cancelled at any time and subject to credit review at least annually.

9b. This item captures other off-balance sheet exposures arising from—

- ◆ commitments with an original maturity of up to one year; or
- ◆ commitments the drawdown of which would give rise to off-balance sheet exposures subject to a CCF of 20%.

9c. This item captures other off-balance sheet exposures arising from—

- ◆ commitments with an original maturity of over one year; or
- ◆ commitments the drawdown of which would give rise to off-balance sheet exposures subject to a CCF of 50%.

10. to 17. Default Risk Exposures (Current Exposure Method): Bilateral Trades – Derivative Contracts (including centrally cleared trades that are treated as bilateral trades)

Reporting AIs that are using the *current exposure method* to

⁵ This is the length of time between the date the commitment is made and the earliest date on which the reporting institution can, at its option, unconditionally cancel the commitment.

calculate the **counterparty default risk** of bilateral trades (including centrally cleared trades that are treated as bilateral trades) arising from derivative contracts should report the trades in these items.

10. ***Exchange rate contracts***

Forward exchange rate contracts arising from swap deposit arrangements are excluded from the calculation of RWA. Under such arrangements, the money deposited by customers is under the control of the reporting AI during the life of the forward contracts, therefore the AI is able to ensure that the customers do not default on the settlement of the forward contracts.

11. Interest rate contracts

12. ***Equity contracts***

13. ***Precious metal contracts***

14. ***Debt security contracts*** or ***other commodity contracts***

15. Credit derivative contracts

This item is intended for the reporting of counterparty default risk exposures arising from ***credit default swaps*** and ***total return swaps***.

Credit risk exposure to reference entities of credit derivative contracts booked in the banking book does not fall within the scope of this item and should be reported in the following manner:

(a) Reporting AI as protection seller

Credit risk exposure to a reference entity of a credit derivative contract is reported as “direct credit substitutes” under item 1 above.

(b) Reporting AI as protection buyer

Credit risk protection provided by a credit derivative contract is either:

- ignored for capital adequacy purposes if the protection is not bought for the purposes of hedging the credit risk of an exposure of the AI or the credit derivative contract is not a ***recognized credit derivative contract***; or
- accounted for in the ways as described in Section C if the protection is bought for the purposes of hedging the credit risk of an exposure of the AI and the credit derivative contract is a recognized credit derivative

contract.

16. Derivative contracts subject to valid bilateral netting agreements

This item refers to the default risk exposure obtained by using the methodology set out in section 95 of the BCR (also see the explanation in paragraph 37). For capital adequacy purposes, only default risk exposures of derivative contracts may be reported on a net basis.

17. Other derivative contracts not specified above

This item is intended for the reporting of default risk exposures in respect of derivative contracts which are not covered by items 10 to 16.

18. Default Risk Exposures (Non-IMM(CCR) Approach): Bilateral Trades – SFTs (including centrally cleared trades that are treated as bilateral trades)

Reporting AIs that are using the methods explained in paragraph 11 to calculate the counterparty default risk of bilateral trades (including centrally cleared trades that are treated as bilateral trades) arising from SFTs should report the trades in this item.

19. to 23. Default Risk Exposures (IMM(CCR) approach): Bilateral Trades (including centrally cleared trades that are treated as bilateral trades)

Reporting AIs that are using the IMM(CCR) approach to calculate the counterparty default risk of bilateral trades (including centrally cleared trades that are treated as bilateral trades) arising from derivative contracts and SFTs should report the trades in these items.

19. Portfolio-level risk-weighted amount based on current market data

The portfolio-level risk-weighted amount calculated under sections 226D(1)(a) and (2)(a) of the BCR should be reported in this item.

20. Portfolio-level risk-weighted amount based on stress calibration

The portfolio-level risk-weighted amount calculated under sections 226D(1)(b) and (2)(b) of the BCR should be reported in this item.

Only the higher of item 19 and item 20 will be used in the calculation of the total risk-weighted amount for credit risk under the STC approach.

21. to 23. Breakdown of Portfolio-level Risk-weighted Amount

Items 21 to 23 capture the breakdown of the portfolio-level risk-weighted amount that will be used in the capital adequacy ratio calculation. In other words, if the portfolio-level risk-weighted amount calculated by using current market data is larger, the data reported in items 21 to 23 should be those that make up the amount reported in item 19.

21. Netting sets (not subject to recognized netting)

This item captures transactions that are not subject to **recognized netting** or that are required to be treated as a separate **netting set** under section 226J(1) of the BCR. If the reporting AI's **IMM(CCR) approval** covers derivative contracts or SFTs and does not exclude **long settlement transactions**, the AI should report long settlement transactions in item 21a or 21b, depending on the nature of the long settlement transactions concerned. If the AI only uses the IMM(CCR) approach for long settlement transactions but not for other transactions, the AI should report the long settlement transactions in item 21c.

22. Netting sets (subject to valid bilateral netting agreements)

This item captures transactions that are subject to valid bilateral netting agreements and that are not required to be treated as a separate netting set under section 226J(1) of the BCR. The reporting treatment for long settlement transactions mentioned in item 21 above applies to item 22.

23. Netting sets (subject to valid cross-product netting agreements)

This item captures transactions that are subject to valid cross-product netting agreements and that are not required to be treated as a separate netting set under section 226J(1) of the BCR.

24. Other off-balance sheet exposures which are not elsewhere reported

Off-balance sheet exposures other than those included in items 1 to 23 above should be reported in this item, these include credit exposures to persons holding collateral posted by the reporting AI (other than collateral posted for centrally cleared trades and held by CCPs) in a manner that is not bankruptcy remote from the persons. For other off-balance sheet exposure, the AI should consult the HKMA on the reporting arrangements.

22. CCFs for OTC derivative transactions under the current exposure method

The CCFs applicable to OTC derivative transactions are set out in the following table:

Residual Maturity	Exchange Rate (including gold)	Interest Rate	Equity	Precious Metal	Debt Security or Other Commodity
1 year or less	1.0%	0%	6.0%	7.0%	10.0%
Over 1 year to 5 years	5.0%	0.5%	8.0%	7.0%	12.0%
Over 5 years	7.5%	1.5%	10.0%	8.0%	15.0%

For a contract with multiple exchanges of principal, the CCF to be used should be multiplied by the number of remaining payments under the contract.

For a contract which is structured to settle outstanding exposures on specified payment dates and the terms of the contract are reset so that the market value of the contract is zero on these dates, the residual maturity of the contract should be treated as being equal to the period until the next reset date. If the contract is an interest rate contract where the remaining time to final maturity of the contract is more than one year, the CCF is subject to a floor of 0.5%.

23. CCFs for credit derivative contracts booked in the trading book under the current exposure method

The CCFs for calculating the **potential exposure** of single-name credit derivative contracts are as follows:

	Protection buyer	Protection seller
Total Return Swap		
Qualifying reference obligation ⁶	5%	5%
Non-qualifying reference obligation ⁶	10%	10%
Credit Default Swap		
Qualifying reference obligation ⁶	5%	5% *
Non-qualifying reference obligation ⁶	10%	10% *

* The protection seller of a credit default swap is required to calculate potential exposure only when such a swap is subject to closeout upon insolvency of the protection buyer while the reference entity is still solvent. The potential exposure of the swap should be capped at the amount of unpaid premium. The protection seller of any credit default swaps without such a “closeout” clause is not required to calculate potential exposure.

In the case of a **first-to-default credit derivative contract**, the CCF for **non-qualifying reference obligation** should be applied to the contract if there is at least one non-qualifying reference obligation in the basket of reference obligations specified in the contract, otherwise, the CCF for **qualifying reference obligation** should be used. In the case of a **second-to-default credit derivative contract**, the CCF for non-qualifying reference obligation should be applied to the contract if there are at least two non-qualifying reference obligations in the basket of reference obligations specified in the contract, otherwise, the CCF for qualifying reference obligation should be used. The same principle applies to other subsequent-to-default credit derivative contracts.

⁶ The definition of “qualifying” is same as that of the “qualifying” category for the treatment of specific risk under the **standardized (market risk) approach** described in Part 8 of the BCR and also includes reference obligations issued by sovereigns whose credit quality grades are 1, 2 or 3 as determined in accordance with section 287 of the BCR.

24. CCFs for other derivative contracts under the current exposure method

For OTC derivative transactions and credit derivative contracts that are not mentioned in paragraphs 22 and 23, the applicable CCFs are the same as those applicable to debt security contracts or other commodity contracts.

25. For off-balance sheet items not mentioned above, a CCF of 100% should be applied unless otherwise specified by the MA.
26. For exchange traded derivative contracts that are treated as bilateral trades for risk-weighting purpose, the CCFs applicable to the contracts should be determined as if they were OTC derivative transactions or credit derivative contracts, as the case requires.

27. Default risk exposures of certain credit derivative contracts under the current exposure method and the IMM(CCR) approach

The default risk exposures of credit derivative contracts falling within the following categories can be regarded as zero:

- (a) Credit default swaps that have been reported as “direct credit substitutes” under item 1 in Division B or as securitization exposures in Form MA(BS)3(IIIId) (i.e. the reporting AI has already held capital against the credit risk of the reference obligations underlying the swaps);
- (b) Recognized credit derivative contracts held by the reporting AI as protection buyer in respect of which the CRM effects have already been taken into account in accordance with Divisions 9 and 10 of Part 4 or Division 5 of Part 7 of the BCR for the purposes of RWA calculation.

Determination of Risk-weights for Off-balance Sheet Items

28. Risk-weights for items other than default risk exposures arising from derivative contracts and SFTs (i.e. items 1 to 9 and 24)

The risk-weight of an off-balance sheet item is determined in the same manner as an on-balance sheet exposure except for the following:

- (a) Asset sales with recourse;
- (b) Forward asset purchases;
- (c) Partly paid-up shares and securities; and
- (d) Direct credit substitutes arising from the selling of credit derivative contracts in the form of total return swaps or credit default swaps booked in the reporting AI's banking book.

The risk-weight of an exposure falling within any of the above categories should be determined as:

- (e) in the case of (a) and (b), the risk-weight allocated to the asset sold/to be purchased or the obligor of the asset, as the case requires;
- (f) in the case of (c), the risk-weight allocated to the relevant shares or securities; and
- (g) in the case of (d), the risk-weight of the relevant reference obligation of the credit derivative contract. The risk-weights of credit derivative contracts which provide credit protection to a basket of exposures should be determined as follows:
 - (i) if the credit derivative contract sold is a first-to-default credit derivative contract, the reporting AI should allocate to the contract a risk-weight which is equal to the sum of the risk-weights of the reference obligations in the basket of reference obligations specified in the contract, subject to a maximum of 1,250%;
 - (ii) if the credit derivative contract sold is a second-to-default credit derivative contract, the AI should allocate to the contract a risk-weight which is equal to the sum of the risk-weights of the reference obligations in the basket of reference obligations specified in the contract, but excluding the reference obligation which carries the lowest risk-weight, subject to a maximum of 1,250%;
 - (iii) if the credit derivative contract sold is some other subsequent-to-default credit derivative contract, the same principle set out in (ii), with all necessary modifications, applies to the contract; and
 - (iv) if the credit derivative contract sold provides credit protection proportionately to the reference obligations in the basket specified in the contract, the risk-weight of the AI's exposure arising from the contract (i.e. RW_a) must be calculated by the following formula:

$$RW_a = \sum_i a_i \times RW_i$$

where:

RW_a = Average risk-weight of a basket of reference obligations

a_i = Proportion of credit protection allocated to a reference obligation

RW_i = Risk-weight of a reference obligation

29. Risk-weights for default risk exposures arising from derivative contracts and SFTs (i.e. items 10 to 23)

The applicable risk-weights are determined as the *attributed risk-weights* allocated to the counterparties of these contracts.

Section C: Calculation and Reporting of Risk-weighted Amount

C.1 On-balance Sheet Exposures

30. If an exposure is not covered by any recognized CRM, the amounts reported in the columns of “Principal Amount” and “Principal Amount after CRM” should be the same.
31. If an exposure is covered fully or partially by recognized CRM, the amount reported in the column of “Principal Amount after CRM” should be adjusted to reflect the CRM effect as set out below:
- (a) **CRM treatment by substitution of risk-weights** (applicable to collateral under the simple approach⁷, guarantees and credit derivative contracts)
- (i) Firstly, identify the class to which the exposure belongs based on the instructions set out in Section B, then report the whole principal amount (after deduction of specific provisions) of the exposure under that class and in the “Principal Amount” column of the row for the risk-weight applicable to that exposure.
- (ii) Secondly, divide the reported “Principal Amount” of the exposure into a credit protection covered portion and a ***credit protection uncovered portion***:
- (A) For guarantees and credit derivative contracts, the value of credit protection is the maximum liability of the ***credit protection provider*** to the reporting AI under the credit protection. However, if there is currency mismatch between the credit protection and the exposure, the covered portion should be reduced by a ***haircut*** for the currency mismatch.

$$G_a = G \times (1 - H_{fx})$$

where:

- G_a = The amount of the exposure covered by credit protection and adjusted for currency mismatch
- G = Maximum liability of the credit protection provider under the credit protection
- H_{fx} = Haircut for currency mismatch, subject to the adjustment set out in section 92 of the BCR (see paragraph E3 of **Annex IIIb-E** for quick reference)

(The value of the ***standard supervisory haircut*** for currency mismatch is set out in Schedule 7 to the BCR. See **Annex IIIb-E** for quick reference).

⁷ For past due exposures secured by collateral, the reporting institution should only use the Simple Approach to CRM treatment.

- (B) For collateral, the value of credit protection is its market value subject to a minimum revaluation frequency of 6 months for non-past due exposures, and 3 months for past due exposures.

If the collateral is real property (which is regarded as recognized collateral only in the case of past due exposures), the market value of the property should be reduced by 10% in the case of residential property and 20% in the case of any other real property. The risk-weight attributed to real property is 100%.

(iii) Thirdly—

- (A) If the exposure covered by recognized CRM is not a past due exposure, report the covered portion under the class to which the ***credit protection*** belongs and in the “Principal Amount after CRM” column of the row for the risk-weight applicable to the credit protection as if the credit protection were an on-balance sheet exposure of the reporting AI. That is, the risk-weight applicable to the credit protection is—

- (if the credit protection is collateral) the one applicable to the collateral subject to a 20% floor except in the situations set out in section 82 of the BCR (see Annex IIIb-C for quick reference);
- (if the credit protection is a guarantee or a credit derivative contract, other than a credit derivative contract that falls within section 100(7)) the one applicable to the ***credit protection provider*** based on whether it has an issuer rating or not, without having regard to whether any of its other debt obligations has an issue specific rating;
- (if the credit protection is a credit derivative contract that falls within section 100(7)) 2% or 4%, as the case requires; or
- (if the collateral is in the form of cash deposits, certificates of deposit or other comparable instruments and it is held at a third-party bank in a non-custodial arrangement and unconditionally and irrevocably pledged or assigned to the AI) the one applicable to the third-party bank determined by the same principle as set out in the second bullet point.

- (B) If the exposure covered by recognized CRM is a past due exposure, report the covered portion under Class XII - Past Due Exposure in the “Principal Amount after CRM” column of the row for the risk-weight applicable to the credit protection.

For both (A) and (B), the RWA of the covered portion is then calculated by multiplying the amount of the covered portion by the risk-weight applicable to the credit protection.

(C) However, if the credit protection for a basket of exposures consists of a credit derivative contract with the following features, the extent of credit protection should be determined as follows:

- if the contract is a recognized first-to-default credit derivative contract, the reporting AI may recognize that credit protection for the exposure in the basket which would carry the lowest RWA in the absence of the credit protection, provided that the principal amount of the exposure is not more than the **notional amount** of the credit derivative contract. The AI may substitute the risk-weight of the credit protection for the risk-weight of that exposure;
- if the contract is a recognized second-to-default credit derivative contract, the reporting AI may substitute the risk-weight of the credit protection for the risk-weight of the exposure in the basket which would carry the second lowest RWA in the absence of the credit protection only if—
 - a. the AI has, as a protection buyer, entered into a recognized first-to-default credit derivative contract of which the basket of reference obligations, or the basket of obligations used for the purposes of determining whether a **credit event** has occurred, is the same as that of the second-to-default credit derivative contract; or
 - b. an obligation in the basket referred to in paragraph a. above has defaulted;
- if the contract is any other subsequent-to-default credit derivative contract, the same principle as that applied to a second-to-default credit derivative contract, with all necessary modifications, applies;
- if the contract provides credit protection proportionately to the reference obligations in the basket specified in the contract, the reporting AI may substitute the risk-weight of the credit protection for the risk-weights of the exposures to the extent of the amounts protected.

The above should be read in conjunction with section 101 of the BCR.

(iv) Lastly, report the amount of the uncovered portion under the class to which the exposure belongs and in the “Principal Amount after CRM”

column of the row for the risk-weight of the exposure. The reported RWA of the uncovered portion is then calculated by multiplying the amount of the uncovered portion by the risk-weight of the exposure.

(b) **CRM treatment by reduction of Principal Amount of exposures**
(applicable to collateral under the *comprehensive approach*, on-balance sheet netting and bilateral netting of repo-style transactions)

(i) **Comprehensive Approach for collateral**

- (A) Firstly, report the whole principal amount (after deduction of specific provisions) of the exposure under the class to which the exposure belongs and in the “Principal Amount” column of the row for the risk-weight applicable to that exposure.
- (B) Secondly, subtract the value of collateral from the reported “Principal Amount” of the exposure by using the formula below. Report the net amount (i.e. E*) in the “Principal Amount after CRM” column under the same class to which the exposure belongs and in the same row for the risk-weight of that exposure.

$$E^* = \max \{0, [E \times (1 + H_e) - C \times (1 - H_c - H_{fx})]\}$$

where:

- E* = Principal amount after CRM
- E = Principal amount of the exposure net of specific provisions, if any
- H_e = Haircut appropriate to the exposure
- C = Current market value of the collateral
- H_c = Haircut appropriate to the collateral
- H_{fx} = Haircut for currency mismatch, if any, between the exposure and the collateral

The values of standard supervisory haircuts are set out in Schedule 7 to the BCR and the required adjustments for transactions with holding period or frequency of re-margining/revaluation different from those underlying the supervisory haircuts are set out in section 92 of the BCR (See **Annex IIIb-E** for quick reference).

- (C) Thirdly, report the RWA calculated by multiplying E* by the risk-weight of the exposure.

(c) **On-balance sheet netting**

- (i) Firstly, identify the class to which the obligor of the exposures belongs and the risk-weight applicable to the obligor. Then, report the aggregate principal amount (after deduction of specific provisions) of

the exposures under that class and in the “Principal Amount” column of the row for the risk-weight applicable to the obligor.

- (ii) Secondly, report the aggregate principal amount of the exposures net of aggregate book value of liabilities in the “Principal Amount after CRM” column under the same class to which the obligor belongs and in the same row for the risk-weight of the obligor. If the exposures are denominated in currencies different from those of the liabilities, the aggregate book value of the liabilities should be reduced by a haircut for the currency mismatch.

$$\begin{array}{l} \text{Principal amount} \\ \text{after CRM} \end{array} = \max \{0, \text{exposures} - \text{liabilities} \times (1 - H_{fx})\}$$

where:

H_{fx} = Haircut for currency mismatch, if any, between the exposures and the liabilities, subject to adjustment set out in section 92 of the BCR (see paragraph E3 of **Annex IIIb-E** for quick reference)

- (iii) Thirdly, the RWA is calculated by multiplying the “Principal Amount after CRM” by the risk-weight of the obligor.

32. Credit protection by means of Credit-linked Notes

If the reporting AI issues a credit-linked note to cover the credit risk of an exposure, the amount of credit protection is the amount of funds received from that note. The amount of the exposure which is covered by the funds is treated as an exposure collateralized by cash deposits.

C.2 Off-balance Sheet Exposures

33. For each off-balance sheet exposure, the reporting AI should identify the relevant item in Division B to which the exposure belongs, and report the exposure in the row for that item. Unlike on-balance sheet exposures, there is no need to report principal amount after CRM and applicable risk-weight in the Form. Only principal amount and RWA should be reported.
34. For the purposes of items 15, 16 and 19 to 23 in Division B, if the derivative contract concerned is a single-name credit default swap that falls within section 226J(1) of the BCR and the default risk exposure in respect of the swap is determined in accordance with section 226J(3) of the BCR, the reporting AI should not take into account any recognized CRM afforded to the swap when calculating the RWA of the swap (see also section 74(6A) of the BCR).

For Items other than Default Risk Exposures arising from Derivative Contracts and SFTs (i.e. items 1 to 9 and 24)

35. If an off-balance sheet exposure is not covered by recognized CRM, the process for calculating the RWA is as follows:

- (a) Firstly, calculate the CEA of the exposure by multiplying the principal amount (after deduction of specific provisions) by the applicable CCF.
- (b) Secondly, multiply the CEA by the applicable risk-weight to calculate the RWA.

36. If an off-balance sheet exposure is covered fully or partially by recognized CRM, the calculation is similar to that of on-balance sheet exposures (see Section C.1), except that in calculating the RWA, CEA is used instead of principal amount (see paragraph 31):

(a) **CRM treatment by substitution of risk-weights** (applicable to collateral under the simple approach, guarantees and credit derivative contracts)

- (i) Firstly, report the whole principal amount (after deduction of specific provisions) of the exposure in the “Principal Amount” column of the row for the item to which the exposure belongs;
- (ii) Secondly, divide the amount above into two portions: the credit protection covered portion and the credit protection uncovered portion (the value of the credit protection for different types of recognized CRM is determined in the same way as explained in Section C.1);
- (iii) Thirdly, multiply the amount of each of the two portions by the CCF applicable to the exposure to come up with two CEAs and report the sum of the two CEAs in the column of “Credit Equivalent Amount”; and
- (iv) Fourthly, obtain two RWAs by—
 - (A) multiplying the CEA of the uncovered portion by the risk-weight applicable to the exposure, and
 - (B) multiplying the CEA of the covered portion by the risk-weight applicable to the credit protection.

The sum of the two RWAs is reported in the column of “Risk-weighted Amount”.

(b) **CRM treatment by reduction of Principal Amount of exposures** (applicable to collateral under the comprehensive approach)

- (i) Firstly, report the whole principal amount (after deduction of specific provisions) of the exposure in the “Principal Amount” column of the row for the item to which the exposure belongs.
- (ii) Secondly, calculate the CEA after CRM by using the following formula and report the amount calculated (i.e. E*) in the column of “Credit Equivalent Amount”:

$$E^* = \max \{0, [E \times (1 + H_e) - C \times (1 - H_c - H_{fx})]\} \times CCF$$

where:

E*	=	CEA after CRM
E	=	Principal amount of the exposure net of specific provisions, if any
H _e	=	Haircut appropriate to the exposure
C	=	Current market value of the collateral
H _c	=	Haircut appropriate to the collateral
H _{fx}	=	Haircut for currency mismatch, if any, between the exposure and the collateral
CCF	=	Credit conversion factor applicable to the exposure

Haircuts are subject to adjustment as set out in section 92 of the BCR (see paragraph E3 of **Annex IIIb-E** for quick reference).

- (iii) Thirdly, multiply E* by the risk-weight of the counterparty and report the RWA calculated in the column of “Risk-weighted Amount”.

For Default Risk Exposures arising from Derivative Contracts under the Current Exposure Method (i.e. items 10 to 17)

37. Contracts which are not covered by valid bilateral netting agreements should be reported under items 10 to 15 and 17. For contracts covered by valid bilateral netting agreements, the reporting AI may report them on a net basis under item 16.

(a) Current exposure method

- (i) Firstly, report the principal amount of the contract(s) in the column of “Principal Amount”.
- (ii) Secondly, calculate the CEA which is the sum of the current exposure and the potential exposure as calculated below:

(A) current exposure is –

- a contract’s mark-to-market replacement cost (if the cost is negative or zero, the current exposure should be taken as zero); or

- (if contracts are covered by a valid bilateral netting agreement) the sum of the positive and negative mark-to-market replacement costs of individual contracts (if the sum so obtained is negative or zero, the current exposure should be taken as zero).

(B) potential exposure (i.e. the add-on) is –

- derived by multiplying the principal amount of a contract by the applicable CCF specified in Section B.2; or
- (if contracts are covered by a valid bilateral netting agreement) derived by the formula set out in paragraph (b) below.

If the exposure arising from the contract(s) falls within section 226Z of the BCR, the CEA should be multiplied by the applicable scaling factor.

(iii) Thirdly, deduct specific provisions and **CVA losses**, if any, from the exposure amount calculated under subparagraph (ii) and report the resultant amount in the column of “Credit Equivalent Amount”.

(iv) Finally, multiply the reported “Credit Equivalent Amount” by the risk-weight applicable to the counterparty to calculate the RWA.

(b) Add-on of derivative contracts subject to recognized netting

The net add-on (A_{Net}) of derivative contracts covered by a valid bilateral netting agreement is calculated by using the following formula:

$$A_{\text{Net}} = 0.4 \times A_{\text{Gross}} + 0.6 \times \text{NGR} \times A_{\text{Gross}}$$

where:

A_{Gross} = The sum of the individual add-on amounts derived by multiplying the principal amounts of all of the individual contracts by the applicable CCFs

NGR = The ratio of net replacement cost for all the contracts to gross replacement cost for all the contracts

The NGR in the above formula can be calculated on a per counterparty basis or on an aggregate basis. However, the basis chosen by the reporting AI should be used consistently. An illustration of the calculation of the NGR based on the two calculation bases is given in **Annex IIIb-G**.

There is no need to calculate the potential exposure of single currency floating/floating interest rate swaps. The current exposure, i.e. replacement cost, of these contracts should be taken as their CEAs.

38. If the (net) exposure to a counterparty is covered fully or partially by recognized CRM, the calculation is similar to that of on-balance sheet exposures (see

Section C.1 above), except that in calculating the RWA, CEA is used instead of principal amount.

(a) **CRM treatment by substitution of risk-weights** (applicable to collateral under the simple approach, guarantees and credit derivative contracts)

- (i) Firstly, report the principal amount of the contract in the column of “Principal Amount”;
- (ii) Secondly, convert the principal amount into a CEA by using the current exposure method. If the exposure arising from the contract falls within section 226Z of the BCR, the CEA should be multiplied by the applicable scaling factor;
- (iii) Thirdly, deduct specific provisions and CVA losses, if any, from the exposure amount calculated under subparagraph (ii) and report the resultant amount in the column of “Credit Equivalent Amount”;
- (iv) Fourthly, divide the amount reported in column “Credit Equivalent Amount” into two portions: the credit protection covered portion and the credit protection uncovered portion; and
- (v) Finally, multiply the credit protection uncovered portion by the risk-weight applicable to the counterparty and the credit protection covered portion by the risk-weight applicable to the credit protection to calculate two RWAs. The sum of the two RWAs is reported in the column of “Risk-weighted Amount”.

(b) **CRM treatment by reduction of Principal Amount of exposures** (applicable to collateral under the comprehensive approach)

- (i) Firstly, report the principal amount of the contract in the column of “Principal Amount”;
- (ii) Secondly, convert the principal amount into a CEA by using the current exposure method. If the exposure arising from the contract falls within section 226Z of the BCR, the CEA should be multiplied by the applicable scaling factor;
- (iii) Thirdly, deduct specific provisions and CVA losses, if any, from the exposure amount calculated under subparagraph (ii) and report the resultant amount in the column of “Credit Equivalent Amount”;
- (iv) Fourthly, calculate the net CEA after CRM by using the following formula:

$$E^* = \max \{0, [E - C \times (1 - H_c - H_{fx})]\}$$

where:

E^*	=	Net CEA after CRM
E	=	Net CEA of off-balance sheet exposure (i.e. the amount obtained from subparagraph (iii) above)
C	=	Current market value of the collateral
H_c	=	Haircut appropriate to the collateral
H_{fx}	=	Haircut for currency mismatch, if any, between the settlement currency and the currency in which the collateral is denominated

Haircuts are subject to adjustment as set out in section 92 of the BCR (see paragraph E3 of **Annex IIIb-E** for quick reference); and

- (v) Finally, multiply E^* by the risk-weight of the counterparty and report the RWA so calculated in the column of “Risk-weighted Amount”.

For SFTs of which the default risk exposures are not calculated by using the IMM(CCR) Approach (i.e. item 18)

39. The reporting AIs should report SFTs as follows:

- (a) Column “Principal amount” – report the aggregate principal amount (after deduction of specific provisions for default risk exposures) of the securities sold or lent, or the money paid or lent, or the securities or money provided as collateral, under the SFTs.
- (b) Column “Principal amount after CRM” –
 - (i) Under the simple approach for collateral, the amount reported in this column should be the same as that reported in the column “Principal amount”.
 - (ii) Under the comprehensive approach for collateral, report the principal amount (after deduction of specific provisions for default risk exposures) net of collateral (i.e. E^*) calculated by using the formula in paragraph 36(b)(ii) (using a CCF of 100%) if the SFTs are not subject to recognized netting or in paragraph 40 if the SFTs are subject to recognized netting.
- (c) Column “Risk-weighted amount” –
 - (i) Under the simple approach for collateral, the CRM effect of any recognized collateral should be reported in the following manner:
 - (A) For each SFT, divide the principal amount (after deduction of specific provisions for default risk exposures) into two portions: the credit protection covered portion and credit protection uncovered portion.
 - (B) Multiply the credit protection covered portion by the risk-weight attributed to the collateral (i.e. the securities or money received by

the AI under the SFT) and multiply the credit protection uncovered portion by the risk-weight applicable to the counterparty to come up with two RWAs.

(C) Repeat the two steps above for each of the SFTs and report the sum of the resulting RWAs in the column of “Risk-weighted Amount”.

(ii) Under the comprehensive approach for collateral, report the RWA calculated by multiplying E^* by the risk-weight applicable to the counterparty.

40. Netting of repo-style transactions

The reporting AI must use the comprehensive approach for collateral if it intends to recognize the CRM effect of a valid bilateral netting agreement for repo-style transactions covered by that agreement. The AI should calculate its net exposure to the counterparty by using the formula below.

$$E^* = \text{Max} \{0, [(\sum (E) - \sum (C)) + \sum (E_s \times H_s) + \sum (E_{fx} \times H_{fx})]\}$$

where:

E^* = Default risk exposure to a counterparty after netting

E = Current market value of money and securities sold/transferred/loaned/paid

C = Current market value of money and securities received

E_s = Absolute value of the net position in the same securities

H_s = Haircut appropriate to the net position in the same securities (i.e. E_s)

E_{fx} = Absolute value of the net position in a currency different from the settlement currency

H_{fx} = Haircut for currency mismatch, if any

Haircuts are subject to adjustment as set out in section 92 of the BCR (see paragraph E3 of **Annex IIIb-E** for quick reference).

In general, repo-style transactions in banking and trading books should be netted separately. Netting across positions in the banking book and the trading book with the same counterparty will be allowed only if:

- all transactions are marked to market daily; and
- the collateral used in the transactions is collateral eligible for being recognized for exposures booked in the banking book.

If the MA has approved the use by the AI of an *internal model* to calculate market risk capital charge, the AI may, with the approval of the MA, use a ***VaR*** model as an alternative to the formula above to calculate its default risk exposure under repo-style transactions covered by valid bilateral netting

agreements on a counterparty-by-counterparty basis. Detailed requirements are set out in section 97 of the BCR (see **Annex IIIb-F** for quick reference).

For Transactions of which the Default Risk Exposures are calculated by using the IMM(CCR) Approach (items 19 to 23)

41. In items 21a to 23, the amount reported in “Default Risk Exposure” should be net of CVA losses if applicable.
42. In items 21b and 22b, the “Principal Amount” of SFTs should be the principal amount of the securities sold or lent, or the money paid or lent, or the securities or money provided as collateral, under the SFTs. The default risk exposures in respect of SFTs calculated by using the IMM(CCR) approach should be reported in the column of “Default Risk Exposure”.
43. In the case of long settlement transactions, the principal amount to be reported in the column of “Principal Amount” will be based on the nature of the transactions (i.e. whether the transactions are akin to SFTs or derivative contracts).
44. In the case of items 22a, b and c and 23, the default risk exposures reported should be the netting set level default risk exposures (i.e. after taking into account the effect of recognized netting).

C.3 Multiple Credit Risk Mitigation

45. An exposure covered by two or more forms of recognized CRM (e.g. with both collateral and guarantee partially covering the exposure) should be divided into different portions which respectively represent the proportions of the exposure covered by each of the forms of the recognized CRM used. The calculation of the RWA of each portion will be done separately. If there is an overlap of coverage between different forms of recognized CRM, the reporting AI may select, in respect of the overlapped portion, the form of recognized CRM which will result in the lowest RWA of that overlapped portion of the exposure.
46. If an exposure is covered by credit protection provided by a single credit protection provider but the credit protection has different maturities, the reporting AI should divide the exposure into different portions according to the maturities of the credit protection. The RWA of each portion should then be calculated separately.
47. If credit protection is obtained for a general banking facility consisting of several types of credit line, the reporting AI may determine how the credit protection should be allocated amongst individual exposures under each of the credit lines.

C.4 Maturity Mismatches

48. For credit protection in the form of collateral, guarantees, credit derivatives, or on-balance sheet netting, where a maturity mismatch (as defined in section 103 of the BCR) exists, the value of the credit protection should be adjusted using the following formula:

$$P_a = P \times (t - 0.25) / (T - 0.25)$$

where:

- P_a = Value of credit protection adjusted for maturity mismatch
 P = Value of credit protection after applying haircuts to adjust for price volatility of collateral and currency mismatch
 t = Min (T, residual maturity of credit protection) expressed in years
 T = Min (5, residual maturity of the exposure) expressed in years

This paragraph does not apply to collateral without a finite maturity (e.g. equities). Maturity of the credit protection should be determined in accordance with sections 103(3) and (4) of the BCR.

Nevertheless, the reporting AI should not take into account the credit protection in its calculation of RWA if the credit protection falls under one of the circumstances set out in section 103(2) of the BCR.

49. **Annex IIIb-H** contains a number of examples to illustrate the capital treatment and reporting arrangement of collateralized exposures based on the simple approach and the comprehensive approach of the credit risk mitigation framework.

Hong Kong Monetary Authority
March 2018

Tables for Mapping Notations used by individual ECAs into the Credit Quality Grades

A. Sovereign Exposures

Credit Quality Grade	Risk-weight	S & P	Moody's	Fitch	R & I	JCR

Application of External Credit Assessments

(A) Nomination of ECAIs

- B1. The reporting AI may nominate, for each of the ECAI ratings based portfolios, one or more than one ECAI the credit assessment ratings issued by which will be used for deriving the risk-weights for exposures in the ECAI ratings based portfolio.
- B2. The ECAI(s) nominated for an ECAI ratings based portfolio should (taken collectively if more than one ECAI is nominated) issue a range of credit assessment ratings which provides a reasonable coverage to the counterparties and the geographical regions in relation to the exposures falling within that portfolio.
- B3. The reporting AI should use the ratings of the nominated ECAI(s) within each of the portfolios consistently.

(B) Use of External Credit Assessments

I. Exposures or issuers regarded as not having an *ECAI rating*

- B4. Any issuer or exposure which does not have an ECAI rating assigned to it by an ECAI nominated by the reporting AI for the relevant ECAI ratings based portfolio should be regarded as not having an ECAI rating.
- B5. In the case of corporate exposures, any corporate incorporated outside India, or any exposure to such corporate, which does not have an ECAI rating assigned to it by any of S&P, Moody's, Fitch, R&I and JCR should be regarded as not having an ECAI rating.

II. Multiple assessments

Exposure with issue specific rating(s)

- B6. If an exposure has only one issue specific rating, that rating should be used to determine the risk-weight of that exposure.
- B7. In cases where there are two or more issue specific ratings assigned by different ECAIs to an exposure and these ratings map to different risk-weights, any one of those ratings should be used except the one or more of those ratings which map to the lowest of those different risk-weights.

Exposure without issue specific rating(s) (“concerned exposure”)

- B8. The reporting AI may determine the risk-weight of the concerned exposure based on either the issuer rating(s) of the obligor of the exposure or the issue specific rating(s) of another debt obligation (reference exposure) undertaken by the same obligor. The reference exposure need not be one held by the AI.

Based on ECAI issuer rating:

- If the obligor of the concerned exposure has only one ECAI issuer rating, the AI should use that rating to determine the risk-weight to be applied to the exposure;
- The AI should follow the principle set out in paragraph B7 to determine the appropriate risk-weight to be applied to the exposure if there are two or more ECAI issuer ratings assigned by different ECAs to the obligor which map to two or more different risk-weights.

Based on issue specific rating:

- If the reference exposure has only one issue specific rating, the AI should use that rating to determine the risk-weight to be applied to the concerned exposure;
- The AI should follow the principles set out in paragraph B7 to determine the appropriate risk-weight to be applied to the concerned exposure if there are two or more issue specific ratings assigned by different ECAs to the reference exposure which map to two or more different risk-weights.

III. Local currency and foreign currency assessments

- B9. In circumstances where exposures without issue specific ratings are risk-weighted based on the issue specific rating of an equivalent exposure to the same borrower, the general rule is that foreign currency ratings would be used for exposures denominated in foreign currencies. Local currency ratings, if available, would only be used to risk-weight exposures denominated in local currencies.
- B10. Nevertheless, the AI may use the foreign currency issuer rating of a borrower to derive a risk-weight for exposures to that borrower which are denominated in the borrower’s local currency. Local currency ECAI ratings should not be used to derive risk-weights for exposures denominated in foreign currencies except for exposures arising from the AI’s participation in any loans extended, or guaranteed against convertibility and transfer risk, by a MDB. The portion of the exposures not benefiting from such a guarantee will be risk-weighted based on the borrower’s foreign currency ECAI ratings, if available.

IV. Others

- B11. In order to avoid any double counting of CRM effect, no CRM effect should be taken into account when calculating the RWA of an exposure if such effect is already reflected in the exposure’s issue specific rating.

Exceptions to the Risk-weight Floor of 20% under the Simple Approach for Collateral

- C1. A risk-weight of less than 20% must not be assigned to recognized collateral under the simple approach except for cases set out below.

Repo-style Transactions

- C2. A risk-weight of 0% can be allocated to recognized collateral received by the AI under repo-style transactions that satisfy all the requirements set out in section 82(2) of the BCR (see paragraphs D2 to D10 of Annex IIIb-D).
- C3. A risk-weight of 10% can be allocated to recognized collateral received by the AI under repo-style transactions that satisfy all the requirements set out in section 82(2)(b) to (h) of the BCR (see paragraphs D3 to D10 of that Annex).

Derivative Contracts

- C4. A risk-weight of 0% can be allocated to recognized collateral received by the AI under a derivative contract, provided that:
- the collateral is cash (as defined in section 82(5) of the BCR);
 - the contract is marked-to-market daily; and
 - there is no currency mismatch between the settlement currency of the contract and the collateral.
- C5. A risk-weight of 10% can be allocated to recognized collateral received by the AI under a derivative contract, provided that (a) the conditions in the 2nd and 3rd bullet points of paragraph C4 are met; and (b) the collateral is debt securities, issued by a sovereign or a *sovereign foreign public sector entity*, which would be allocated a risk-weight of 0% under the STC approach.

Other Transactions

- C6. A 0% risk-weight can be allocated to recognized collateral received by the AI under a transaction other than those mentioned above if there is no currency mismatch between the transaction and the collateral, and the collateral is either:
- cash (as defined in section 82(5) of the BCR); or
 - debt securities, issued by a sovereign or a sovereign foreign public sector entity, which would be allocated a risk-weight of 0% under the STC approach and the current market value of which has been discounted by 20%.

Criteria for Preferential Treatment of Repo-style Transactions

- D1. Under the comprehensive approach for collateral, repo-style transactions which satisfy all the requirements in section 82(2) of the BCR are not required to be subject to any haircuts. This is, however, not applicable to AIs which use VaR models instead of haircuts to reflect the price volatility of both exposures and collateral under these transactions (see **Annex IIIb-F**). The requirements in section 82(2) are summarized in the paragraphs below.
- D2. The counterparty is—
- a sovereign;
 - a PSE;
 - a MDB;
 - a bank or securities firm;
 - a corporate (other than a bank or securities firm) which is a financial institution (including an *insurance firm*) with an attributed risk-weight of not more than 20%; or
 - a clearing organization as defined in section 82(2)(a)(vi) of the BCR.
- D3. Both the exposure and collateral are—
- cash (as defined in section 82(5) of the BCR); or
 - securities issued by sovereigns or sovereign foreign PSEs, which would be allocated a risk-weight of 0% under the STC approach.
- D4. There is no currency mismatch between the exposure and the collateral.
- D5. Either the transaction is an overnight transaction or both the exposure and the collateral are subject to daily mark-to-market and daily remargining.
- D6. The reporting AI reasonably expects that, if the counterparty fails to remargin, it is able to realize the collateral for its benefit within four business days beginning on the day after the day on which the exposure is marked-to-market for the last time before the counterparty's failure to deliver the shortfall in margin.
- D7. The transaction is settled through a settlement system customarily used for repo-style transactions.
- D8. Standard market documentation for repo-style transactions in the securities concerned is used for the transaction.
- D9. The documentation of the transaction specifies that the AI may terminate the transaction immediately if the counterparty commits an event of default or an event of default occurs in respect of the counterparty.

- D10. Upon any event of default, regardless of whether the counterparty is insolvent or bankrupt, the AI has an unfettered and legally enforceable right to immediately seize and realize the collateral for its benefit.

Standard Supervisory Haircuts for the Comprehensive Approach for Collateral

E1. The standard supervisory haircuts set out in the table below assume daily mark-to-market, daily remargining and a 10-business-day holding period.

Part 1 – Standard Supervisory Haircuts for Debt Securities					
Type of asset	Credit Quality Grade / Short-term Credit Quality Grade	Residual Maturity	Standard Supervisory Haircuts		
			Non-securitization exposures		Securitization exposures ⁹ (excluding re-securitization exposures)
			Sovereign issuers ¹⁰	Other issuers ¹¹	
Debt securities issued by any issuers with ECAI issue specific ratings (In the case of collateral, means those falling within any of s.79(1)(e) to (la) of the BCR)	Grade 1 (S&P, Moody's, Fitch, R&I & JCR) Grades 1 and 2 (ICRA, CARE & CRISIL)	≤ 1 year	0.5%	1%	2%
		> 1 year but ≤ 5 years	2%	4%	8%
		> 5 years	4%	8%	16%
	Grades 2 and 3 (S&P, Moody's, Fitch, R&I & JCR) Grades 3 and 4 (ICRA, CARE & CRISIL)	≤ 1 year	1%	2%	4%
		> 1 year but ≤ 5 years	3%	6%	12%
		> 5 years	6%	12%	24%
Debt securities issued by any issuers with long term ECAI issue specific ratings	Grade 4 (S&P, Moody's, Fitch, R&I & JCR)	All	15%	25%	25%
Recognized collateral with long term ECAI issue specific ratings falling within s.79(1)(e), (f) or (h) of the BCR	Grade 4 (S&P, Moody's, Fitch, R&I & JCR)	All	15%	N.A.	N.A.

⁹ The ECAI issue specific ratings of securitization issues should be mapped to the scale of credit quality grades in Part 1 of Table C or Part 1 of Table E in Schedule 6 to the BCR.

¹⁰ Sovereign issuers include multilateral development banks (MDBs) and sovereign foreign public sector entities. The ECAI issue specific ratings of debt securities issued by MDBs should be mapped to the scale of credit quality grades in Table A or Part 1 of Table E in Schedule 6 to the BCR.

¹¹ Other issuers include public sector entities which are not sovereign foreign public sector entities.

Part 1 – Standard Supervisory Haircuts for Debt Securities					
Type of asset	Credit Quality Grade / Short-term Credit Quality Grade	Residual Maturity	Standard Supervisory Haircuts		
			Non-securitization exposures		Securitization exposures ⁹ (excluding re-securitization exposures)
			Sovereign issuers ¹⁰	Other issuers ¹¹	
Debt securities without ECAI issue specific ratings issued by banks which satisfy the criteria set out in s.79(1)(m) of the BCR. (In the case of collateral, means those falling within s.79(1)(m) of the BCR)	N.A.	≤ 1 year	N.A.	2%	N.A.
		> 1 year but ≤ 5 years	N.A.	6%	N.A.
		> 5 years	N.A.	12%	N.A.

Part 2 – Standard Supervisory Haircuts for Assets other than Debt Securities	
Type of asset	Standard Supervisory Haircuts
Cash where both the exposure and collateral are in the same currency (In the case of collateral, means those falling within s.79(1)(a), (b) or (c) of the BCR where the exposure is in the same currency as that of the collateral)	0%
Equities in the <i>main index</i> (including convertible bonds) and gold (In the case of collateral, means those falling within s.79(1)(d) or (n) of the BCR)	15%
Other equities (including convertible bonds) listed on a <i>recognized exchange</i> (In the case of collateral, means those falling within s.80(1)(b) of the BCR)	25%
Collective investment schemes (In the case of collateral, means those falling within s.79(1)(o) or s.80(1)(c) of the BCR)	Highest haircut applicable to any <i>financial instruments</i> in which the scheme can invest

Part 3 – Standard Supervisory Haircuts for Exposures and Collateral not falling within Parts 1 and 2 of this Table	
Type of asset	Standard Supervisory Haircuts
Exposures and collateral of repo-style transactions which satisfy the criteria set out in section 82(2) of the BCR	0%

Part 3 – Standard Supervisory Haircuts for Exposures and Collateral not falling within Parts 1 and 2 of this Table	
Type of asset	Standard Supervisory Haircuts
Exposures arising from currency mismatch	8%
Exposures of transactions under which the financial instruments lent by an AI do not fall within Parts 1 and 2 of this Table	25%
Collateral which does not fall within s.80(1)(a), (b) and (c) of the BCR received by an AI under repo-style transactions booked in the trading book.	25%
Exposures not specified in this Table	25%

- E2. Reporting AIs should distinguish transactions amongst three types, viz., repo-style transactions, other capital market transactions (i.e. derivative contracts and margin lending) and secured lending. Providing the transactions are subject to daily revaluation or remargining, the assumed **minimum holding period** of these three types of transaction are as follows:

Type of Transactions	Minimum Holding Period	Condition
Repo-style transactions	5 business days	Daily remargining
Other capital market transactions	10 business days	Daily remargining
Secured lending	20 business days	Daily revaluation

For an exposure of the AI arises from a transaction or netting set that falls within section 226M(2) or 226M(3) of the BCR, the assumed minimum holding period should be at least 20 business days as required in that section. If the exposure arises from a transaction or netting set that falls within section 226M(7) of the BCR, the assumed minimum holding period should be at least double the original minimum holding period applicable to the exposure (see section 91(2) of the BCR).

- E3. If a transaction has a minimum holding period different from 10 business days or is not remargined or revalued daily as assumed in the standard supervisory haircuts, reporting AIs should scale up or down the standard supervisory haircuts (H_e , H_c and H_{fx}) using the following formula when applying the haircuts to the calculation of the RWA of the transaction:

$$H = H_{10} \times \sqrt{\frac{N_R + (T_M - 1)}{10}}$$

where:

H = Haircut after adjustment for differences in holding period and revaluation frequency

H_{10} = Standard supervisory haircut based on a minimum holding period of 10 business days

T_M = Minimum holding period for a particular type of transaction as set out in paragraph E2.

N_R = Actual number of days between remargining or revaluation of collateral

- E4. For repo-style transactions booked in the trading book, recognized collateral is expanded to include any securities received by the AI provided that the securities meet the requirements set out in section 77 of the BCR.

Use of Value-at-risk Models for Repo-style Transactions Covered by a Valid Bilateral Netting Agreement

- F1. Reporting AIs which have obtained approval from the MA for using internal models to measure market risk exposures may, with the approval of the MA, use a VaR model instead of standard supervisory haircuts for the purposes of calculating the net credit exposure to a given counterparty under repo-style transactions covered by a valid bilateral netting agreement.
- F2. The quantitative and qualitative criteria for recognition of a VaR model for repo-style transactions are substantially similar to those for an internal model for market risk (see section 97 of the BCR for details).
- F3. The minimum holding period of repo-style transactions should be adjusted upward (a) if the liquidity of the securities concerned does not justify a 5-day holding period; and (b) should be increased in the manner set out in section 226M(2), (3) or (7) of the BCR if the *nettable* repo-style transactions constitute a netting set which falls within that section. If the *nettable* repo-style transactions are not subject to daily remargining, the VaR model should assume a minimum holding period which is at least equal to the minimum holding period calculated by the following formula (see also section 97(4) of the BCR):

$$\text{Minimum holding period} = F + N - 1$$

where—

F = 5 business days or the minimum holding period determined in accordance with section 226M(2) or (3) of the BCR, as the case may be

N = actual number of days between each remargining of the transactions

Moreover, the VaR model should take into account the correlation effects between securities positions.

- F4. It is one of the initial and on-going recognition criteria that AIs intending to use or using VaR models should prove the quality of the models to the MA through *back-testing* the models' output using data covering at least a one-year period. The back-testing should cover a number of representative counterparty portfolios (whether actual or hypothetical) which have been chosen based on the sensitivity of the portfolios to the material risk factors and correlations to which the AIs are exposed.

- F5. The net credit exposure to a counterparty arising from nettable repo-style transactions is calculated by using the following formula:

$$E^* = \max \{0, [\sum (E) - \sum (C) + \text{VaR output}]\}$$

where:

E^*	=	Default risk exposure to counterparty after netting
E	=	Current market value of money and securities sold, transferred, loaned or paid by the AI
C	=	Current market value of money and securities received by the AI
VaR output	=	The VaR number of previous business day generated by the VaR model

Example of calculating the Net to Gross Ratio (NGR)

G1. The following table illustrates how the NGR is calculated on a per counterparty basis and on an aggregate basis:

Transaction	Counterparty A		Counterparty B		Counterparty C	
	Notional amount	Mark to market value	Notional amount	Mark to market value	Notional amount	Mark to market value
Outstanding contract 1	100	10	50	8	30	-3
Outstanding contract 2	100	-5	50	2	30	1
Gross replacement cost (GR)		10		10		1
Net replacement cost (NR)		5		10		0
NGR (per counterparty)	0.5		1		0	
NGR (aggregate)	$\Sigma \text{NR} / \Sigma \text{GR} = 15 / 21 = 0.71$					

G2. The gross replacement costs (GR) include only the sums of positive market values, they are therefore, 10, 10 and 1 respectively for counterparties A, B and C. The corresponding net replacement costs (NR) are the non-negative sums of both positive and negative market values, i.e. 5, 10 and 0 for A, B and C respectively. Accordingly, the NGR calculated on a per counterparty basis should be $5/10 = 0.5$, $10/10 = 1$ and $0/1 = 0$ for A, B and C respectively. Based on the per counterparty NGR, the net potential exposure on a per counterparty basis can be calculated using Formula 8 in section 95 of the BCR. The aggregate net potential exposure would be the sum of the per counterparty net potential exposure.

G3. If the NGR is calculated on an aggregate basis, it will be the ratio of total net replacement costs to total gross replacement costs, i.e. $15/21 = 0.71$. The aggregate net potential exposure is then calculated by substituting this ratio into Formula 8 for each individual counterparty, i.e. A, B and C.

Illustrations on Reporting of Credit Risk Mitigation Techniques**1. Collateralized loan**

The reporting AI provides a 5-year term loan of HK\$1,000 M to an unrated corporate. The loan is secured by debt securities issued by a bank and denominated in EURO. The debt securities are rated AA by the Standard & Poor's and have a remaining maturity of 7 years. They are subject to daily revaluation and presently have a market value in HKD equivalent amount of HK\$1,050 M.

Simple Approach

Working:

- A loan to an unrated corporate is subject to a risk-weight of 100%.
- An external credit assessment of "AA" by the Standard & Poor's is equivalent to a credit quality grade "1" in the supervisory risk-weighting scale for banks, which is mapped to a risk-weight of 20%.
- As the market value of the collateral debt securities is HK\$1,050 M, the loan is fully secured.
- RWA of the loan: HK\$1,000 M x 20% = HK\$200 M.

Reporting illustration:

Division A: Risk-weighted Amount (On-balance Sheet)

Item	Nature of item	Principal Amount HK\$'000	Principal Amount After CRM HK\$'000	x Risk Weight %	= Risk-weighted Amount HK\$'000
Class IV	Bank Exposures				
7a.	Exposures with original maturity of more than three months:				
7a(i)	Risk-weight 20%		1,000,000	20	200,000
7a(ii)	Risk-weight 50%			50	
7a(iii)	Risk-weight 100%			100	
7a(iv)	Risk-weight 150%			150	
SUBTOTAL			1,000,000		200,000
Class VI	Corporate Exposures				
9a.	Risk-weight 20%			20	
9b.	Risk-weight 30%			30	
9c.	Risk-weight 50%			50	
9d.	Risk-weight 100%	1,000,000	0	100	0
9e.	Risk-weight 150%			150	

SUBTOTAL	1,000,000	0		0
----------	-----------	---	--	---

Comprehensive Approach

Working:

- The standard supervisory haircut for debt securities with a credit quality grade “1” issued by banks is 8%.
- The standard supervisory haircut for currency mismatch between the underlying exposure and collateral is also 8%.
- As the standard supervisory haircuts only assume a 10-day holding period, the 8% haircuts for both the collateral as well as the currency mismatch have to be scaled up to haircuts for 20-day holding period (which is the minimum holding period assumed for secured lending transactions) using the following formula:

$$H = H_{10} \times \sqrt{\frac{N_R + (T_M - 1)}{10}}$$

where:

H = Haircut after adjustment for differences in holding period and revaluation frequency

H₁₀ = Standard supervisory haircut which assumes a minimum 10-day holding period

T_M = Minimum holding period for the type of transaction (which is different from a holding period of 10 days)

N_R = Actual number of days between revaluation

- The adjusted haircuts for the collateral and the currency mismatch in this example are therefore:

$$\begin{aligned} H &= 8\% \times \sqrt{\frac{1 + (20 - 1)}{10}} \\ &= 11\% \text{ (rounded up to a percentage)} \end{aligned}$$

- The value of exposure after CRM is calculated as:

$$E^* = \max \{0, [E \times (1 + H_e) - C \times (1 - H_c - H_{fx})]\}$$

where:

E* = Principal Amount after CRM

E = Principal Amount of the exposure

H_e = Haircut appropriate to the exposure

C = Value of the collateral

H_c = Haircut appropriate to the collateral

H_{fx} = Haircut appropriate to currency mismatch between the exposure and the collateral

- As the lending involves only cash, no haircut is required for the loan exposure (i.e. $H_e = 0$).
- $E^* = \max \{ \text{HK\$0}, [\text{HK\$1,000 M} \times (1 + 0\%) - \text{HK\$1,050 M} \times (1 - 11\% - 11\%)] \}$
 $= \max (\text{HK\$0}, \text{HK\$181 M})$
 $= \text{HK\$181 M}$
- The RWA of the transaction is calculated by multiplying the value of exposure after CRM (HK\$181 M) with the risk-weight of the unrated corporate (100%), which equals HK\$181 M.

Reporting illustration:

Division A: Risk-weighted Amount (On-balance Sheet)

Item	Nature of item	Principal Amount HK\$'000	Principal Amount After CRM HK\$'000	x Risk Weight %	= Risk-weighted Amount HK\$'000
Class IV	Bank Exposures				
7a.	Exposures with original maturity of more than three months:				
7a(i)	Risk-weight 20%			20	
7a(ii)	Risk-weight 50%			50	
7a(iii)	Risk-weight 100%			100	
7a(iv)	Risk-weight 150%			150	
SUBTOTAL					
Class VI	Corporate Exposures				
9a.	Risk-weight 20%			20	
9b.	Risk-weight 30%			30	
9c.	Risk-weight 50%			50	
9d.	Risk-weight 100%	1,000,000	181,000	100	181,000
9e.	Risk-weight 150%			150	
SUBTOTAL		1,000,000	181,000		181,000

2. Collateralized loan commitment

Now presuming the corporate borrower in the above example has not yet drawn down the loan facility, the transaction will be recorded as commitment in the book of the reporting AI. Assuming that the commitment cannot be cancelled unconditionally, capital requirement of the transaction under the two approaches will be calculated as follows:

Simple Approach

Working:

- As the amount of commitment of a 5-year term loan is HK\$1,000 M and the market value of the collateral debt securities is HK\$1,050 M, the commitment is considered fully secured.
- The commitment for a 5-year term loan attracts a CCF of 50% as it cannot be cancelled unconditionally. Its CEA is therefore calculated at: HK\$1,000 M x 50% = HK\$500 M.
- A 20% risk-weight for the debt securities is applied to calculate the RWA of this secured transaction: HK\$500 M x 20% = HK\$100 M.

Reporting illustration:

Division B: Risk-weighted Amount (Off-balance Sheet)

Item	Nature of item	Principal Amount HK\$'000	Credit Conversion Factor %	Credit Equivalent Amount HK\$'000	Risk-weighted Amount HK\$'000
1.	Direct credit substitutes		100		
2.	Transaction-related contingencies		50		
3.	Trade-related contingencies		20		
4.	Asset sales with recourse		100		
5.	Forward asset purchases		100		
6.	Partly paid shares and securities		100		
7.	Forward forward deposits placed		100		
8.	Note issuance and revolving underwriting facilities		50		
9a.	Commitments that are unconditionally cancellable without prior notice		0		0
9b.	Other commitments (CCF at 20%)		20		
9c.	Other commitments (CCF at 50%)	1,000,000	50	500,000	100,000
SUBTOTAL		1,000,000		500,000	100,000

Comprehensive Approach

Working:

- The standard supervisory haircuts for both the collateral debt securities and the currency mismatch between the underlying exposure and the collateral are scaled up from 8% to 11% (as shown in Example 1 above).
- The CEA after CRM is calculated by the following formula (which mirrors the formula for on-balance sheet exposures provided in Example 1):

$$\begin{aligned}
 E^* &= \text{Max} \{0, [E \times (1 + H_e) - C \times (1 - H_c - H_{fx})]\} \times \text{CCF} \\
 &= \text{Max} \{ \text{HK\$}0, [\text{HK\$}1,000 \text{ M} \times (1 + 0\%) - \text{HK\$}1,050 \text{ M} \times (1 - 11\% - 11\%)] \} \times 50\% \\
 &= \text{HK\$}90.5 \text{ M}
 \end{aligned}$$

- As the CEA after CRM is HK\$90.5 M and the risk-weight for an unrated corporate is 100%, the RWA of this secured commitment is: HK\$90.5 M x 100% = HK\$90.5 M.

Reporting illustration:

Division B: Risk-weighted Amount (Off-balance Sheet)

Item	Nature of item	Principal Amount HK\$'000	Credit Conversion Factor %	Credit Equivalent Amount HK\$'000	Risk-weighted Amount HK\$'000
1.	Direct credit substitutes		100		
2.	Transaction-related contingencies		50		
3.	Trade-related contingencies		20		
4.	Asset sales with recourse		100		
5.	Forward asset purchases		100		
6.	Partly paid shares and securities		100		
7.	Forward forward deposits placed		100		
8.	Note issuance and revolving underwriting facilities		50		
9a.	Commitments that are unconditionally cancellable without prior notice		0		0
9b.	Other commitments (CCF at 20%)		20		
9c.	Other commitments (CCF at 50%)	1,000,000	50	90,500	90,500
SUBTOTAL		1,000,000		90,500	90,500

3. Collateralized OTC Derivative Transactions

The reporting AI has a HK\$1,000 M interest rate contract with a four-year residual maturity. The counterparty to the contract is an unrated corporate. Pledged as collateral for the contract is a HK\$8 M corporate bond with an “A1” Moody’s rating. This is also a capital market transaction subject to daily remargining and there is neither maturity nor currency mismatch between the interest rate contract and the collateral. The current exposure and potential exposure of the contract are HK\$10 M and HK\$5 M respectively.

Simple Approach

Working:

- CEA of the interest rate contract is the sum of current exposure and potential exposure (i.e. HK\$10 M + HK\$5 M = HK\$15 M)
- The HK\$8 M corporate bond attracts a 50% risk-weight
- RWA of secured portion: HK\$8 M x 50% = HK\$ 4 M
- RWA of unsecured portion: HK\$7 M x 100% = HK\$ 7 M
- Total RWA (secured + unsecured): HK\$4 M + HK\$ 7 M = HK\$ 11 M

Reporting illustration:

Division B: Risk-weighted Amount (Off-balance Sheet)

11. Interest rate contracts

	Residual Maturity	Principal Amount HK\$'000	Current Exposure HK\$'000	Potential Exposure HK\$'000	Credit Equivalent Amount HK\$'000	Risk-weighted Amount HK\$'000
11 a.	1 year or less					
11 b.	Over 1 year to 5 years	1,000,000	10,000	5,000	15,000	11,000
11 c.	Over 5 years					
SUBTOTAL		1,000,000	10,000	5,000	15,000	11,000

Comprehensive Approach

Working:

- As this is a capital market transaction, there is no need to scale up the 6% haircut applicable to the corporate bond as collateral.
- The adjusted exposure of the transaction is calculated by the following formula (which mirrors the formula for on-balance sheet exposures provided in Example 1):

$$\begin{aligned} E^* &= \text{Max} \{0, [(\text{current exposure} + \text{potential exposure}) - C \times (1 - H_c - H_{fx})]\} \\ &= \text{Max} \{ \text{HK\$}0, [\text{HK\$}15 \text{ M} - \text{HK\$}8 \text{ M} \times (1 - 6\% - 0\%)] \} \\ &= \text{Max} (\text{HK\$}0, \text{HK\$}7.48 \text{ M}) \\ &= \text{HK\$}7.48 \text{ M} \end{aligned}$$

- RWA is calculated at: $\text{HK\$}7.48 \text{ M} \times 100\% = \text{HK\$}7.48 \text{ M}$

Reporting illustration:

Division B: Risk-weighted Amount (Off-balance Sheet)

11. Interest rate contracts

	Residual Maturity	Principal Amount HK\$'000	Current Exposure HK\$'000	Potential Exposure HK\$'000	Credit Equivalent Amount HK\$'000	Risk-weighted Amount HK\$'000
11 a.	1 year or less					
11 b.	Over 1 year to 5 years	1,000,000	10,000	5,000	15,000	7,480
11 c.	Over 5 years					
SUBTOTAL		1,000,000	10,000	5,000	15,000	7,480

Completion Instructions

Return of Capital Adequacy Ratio Part IIIc – Risk-weighted Amount for Credit Risk Internal Ratings-based Approach Form MA(BS)3(IIIc)

Introduction

1. Form MA(BS)3(IIIc) (“IRB return”) of Part III should be completed by each authorized institution incorporated in Hong Kong (AI) using the *internal ratings-based approach (IRB approach)* to calculate *credit risk* under Part 6 of the Banking (Capital) Rules.
2. These completion instructions contain the following four sections:

<u>Section A</u>	<u>General Instructions</u>	<u>Paragraphs</u>
I	Scope of the IRB return	5-6
II	Classification of exposures	7-8
III	Choice of IRB calculation approaches	9
IV	Structure of the IRB return	10-12
V	Definitions and clarification	13-40
<u>Section B</u>	<u>Calculation of Risk-weighted Amount for Credit Risk under IRB Approach</u>	
I	Risk-weighted amount under IRB approach	41-45
II	General requirements for all IRB classes	46-54
III	Specific requirements for certain exposure portfolios	55-58
IV	Corporate, sovereign and bank exposures	59-107
V	Retail exposures	108-117
VI	Equity exposures	118-133
VII	Other exposures	134-135
VIII	Purchased receivables	136-141
IX	Leasing transactions	142-143
X	Securities financing transactions	144-151
XI	Credit-linked notes	152-153
XII	Calculation of risk-weighted amount of off-balance sheet exposures	154-185
XIII	Credit risk mitigation	186-232

XIV	Application of scaling factor	233-234
<u>Section C</u>	<u>Treatment of Expected Losses and Eligible Provisions under IRB Approach</u>	
I	Determination of total EL amount	235-238
II	Determination of total eligible provisions	239-242
III	Treatment of total EL amount and total eligible provisions	243-245
<u>Section D</u>	<u>Specific Instructions</u>	
	Form IRB_TOTCRWA	246
	Form IRB_CSB	247
	Form IRB_SLSLOT	248
	Form IRB_RETAIL	249
	Form IRB_EQUSRW	250
	Form IRB_EQUINT	251
	Form IRB_EQUPDLGD	252
	Form IRB_EQUO	253
	Form IRB_OTHER	254
	Form IRB_FIRBLGD	255-256
	Form IRB_AIRBLGD	257-258
	Form IRB_OBSND	259
	Form IRB_OBSD_N_IMM	260
	Form IRB_OBSD_IMM	261
	Form IRB_ELEP	262

3. Section A gives the general instructions and definitions for the reporting of the IRB return. Section B provides the specific instructions for calculating the ***risk-weighted amount*** for each ***IRB class/subclass*** under the IRB approach. Section C explains the calculation of ***total EL amount*** and ***total eligible provisions*** and the capital treatment for the difference between these two items under the IRB approach. Section D explains the specific reporting instructions for each reporting form, with illustrative examples provided in **Annex IIIc-A**.
4. This return and its completion instructions should be read in conjunction with the Rules and the relevant supervisory policy/guidance on the revised capital adequacy framework.

Section A: General Instructions

I. Scope of the IRB Return

5. An AI is required to report in this return its credit **exposures** subject to the IRB approach, including:
- (a) all of the AI's on-balance sheet exposures and off-balance sheet exposures booked in its **banking book**, except for exposures that are required to be deducted from any of the AI's **Common Equity Tier 1 capital (CET1 capital)**, **Additional Tier 1 capital** and **Tier 2 capital**¹, exposures to a **central counterparty (CCP)**² and **securitization exposures**³;
 - (b) all of the AI's exposures to counterparties –
 - (i) under **over-the-counter derivative transactions (OTC derivative transactions)**, **credit derivative contracts** or **securities financing transactions (SFTs)** booked in an AI's **trading book**; or
 - (ii) in respect of assets that are –
 - posted by the AI as collateral for transactions or contracts booked in its trading book; and
 - held by the counterparties in a manner that is not bankruptcy remote from the counterparties,
- except for exposures that are subject to deduction from any of the AI's CET1 capital, Additional Tier 1 capital and Tier 2 capital and exposures to a CCP.
6. Subject to the Monetary Authority's (MA) **prior consent**, an AI using the IRB approach may simultaneously have a portion of its credit exposures subject to the **basic approach (BSC approach)** and/or the **standardized (credit risk) approach (STC approach)**, which should be reported in Form MA(BS)3(IIIa) and/or Form MA(BS)3(IIIb) according to the respective reporting requirements.

II. Classification of Exposures

7. In reporting this return, an AI should classify each of its credit exposures into one of the six IRB classes and then sub-classify each of these exposures into one of the

¹ Exposures that are required to be deducted from an AI's CET1 capital, Additional Tier 1 capital and/or Tier 2 capital should be reported in Form MA(BS)3(II).

² Exposures to CCPs should be reported in Form MA(BS)3(IIIe).

³ Securitization exposures include **re-securitization exposures** unless stated otherwise. Securitization exposures in the banking book should be reported in Form MA(BS)3(IIIId), while securitization exposures in the trading book should be reported in Form MA(BS)3(IV).

twenty six IRB subclasses as shown in the table below in accordance with the definitions given in paragraphs 13 to 33:

IRB Class		IRB Subclass	
1.	Corporate exposures	(1)	Specialized lending under supervisory slotting criteria approach (project finance)
		(2)	Specialized lending under supervisory slotting criteria approach (object finance)
		(3)	Specialized lending under supervisory slotting criteria approach (commodities finance)
		(4)	Specialized lending under supervisory slotting criteria approach (income-producing real estate)
		(5)	Specialized lending (high-volatility commercial real estate)
		(6)	Small-and-medium sized corporates
		(7)	Other corporates
2.	Sovereign exposures	(8)	Sovereigns
		(9)	Sovereign foreign public sector entities
		(10)	Multilateral development banks
3.	Bank exposures	(11)	Banks
		(12)	Securities firms
		(13)	Public sector entities (excluding sovereign foreign public sector entities)
4.	Retail exposures	(14)	Residential mortgages to individuals
		(15)	Residential mortgages to property-holding shell companies
		(16)	Qualifying revolving retail exposures
		(17)	Small business retail exposures
		(18)	Other retail exposures to individuals
5.	Equity exposures	(19)	Equity exposures under market-based approach (simple risk-weight method)

IRB Class		IRB Subclass	
		(20)	Equity exposures under market-based approach (internal models method)
		(21)	Equity exposures under PD/LGD approach (publicly traded equity exposures held for long-term investment)
		(22)	Equity exposures under PD/LGD approach (privately owned equity exposures held for long-term investment)
		(23)	Equity exposures under PD/LGD approach (other publicly traded equity exposures)
		(24)	Equity exposures under PD/LGD approach (other equity exposures)
6.	Other exposures	(25)	Cash items
		(26)	Other items

8. Purchased receivables do not form an IRB class on their own and should be classified as **corporate** exposures or retail exposures, as the case requires.

III. Choice of IRB Calculation Approaches

9. Under the IRB approach, an AI may use the following IRB calculation approaches for each of the six IRB classes, provided that the relevant criteria and qualifying conditions are met:

IRB class	Corporate	Sovereign	Bank	Retail	Equity	Other
Approaches available	foundation IRB approach	foundation IRB approach	foundation IRB approach	retail IRB approach	market-based approach: simple risk-weight method	specific risk-weight approach
	advanced IRB approach	advanced IRB approach	advanced IRB approach		market-based approach: internal models method	
	supervisory slotting criteria approach				PD/LGD approach	

IV. Structure of the IRB Return

10. The IRB return consists of the following six divisions:

Division A: Summary of Risk-weighted Amount for Credit Risk under IRB Approach – showing the risk-weighted amount by IRB class/subclass and the effect of the scaling factor; a breakdown of the risk-weighted amount for selected types of exposures and the **CVA risk-weighted amount**⁴ for **CVA risk** is also shown;

Division B: Risk-weighted Amount by IRB Class/Subclass – providing information on the **credit risk components** and risk-weighted amount of individual IRB subclasses or, where applicable, individual portfolio types;

Division C: LGD for Corporate, Sovereign and Bank Exposures – providing supplementary information on **LGD** of individual IRB subclasses or, where applicable, individual portfolio types for **corporate**, **sovereign** and **bank** exposures under the **foundation IRB approach** or the **advanced IRB approach**;

Division D: Off-Balance Sheet Exposures (Other than OTC Derivative Transactions, Credit Derivative Contracts and SFTs) under IRB Approach – providing supplementary information to Division B by giving a breakdown of off-balance sheet exposures (other than OTC derivative transactions, credit derivative contracts and SFTs) for corporate, sovereign, bank and retail exposures;

Division E: Off-Balance Sheet Exposures (OTC Derivative Transactions, Credit Derivative Contracts and SFTs) under IRB Approach – providing supplementary information to Division B by giving a breakdown of OTC derivative transactions, credit derivative contracts and SFTs for corporate, sovereign, bank and retail exposures; and

Division F: EL-EP Calculation under IRB Approach – providing a breakdown of the respective **EL amount** and **eligible provisions** for corporate, sovereign, bank and retail exposures and calculating the difference between the two, if any, for the computation of the capital base.

11. There are multiple forms in Divisions B, C and E of this return for the reporting of different IRB subclasses of exposures or exposures subject to different calculation methods. A list showing the reporting forms under various divisions is given at **Annex IIIc-B**. For Divisions A, D and F, an AI is required to report the positions of all relevant IRB classes/subclasses in one single form. For Divisions B and C, the position of each IRB subclass (or, where applicable, each portfolio type) should be reported separately in the form applicable to that IRB subclass (or that portfolio type). For Division E, the positions should be reported separately according to the methods the AI adopts for the calculation of **default risk exposures** in respect of OTC

⁴ The term “CVA” in “CVA risk-weighted amount” refers to “**credit valuation adjustment**” – see definition in section 2(1) of the Rules. The CVA risk-weighted amount is the aggregate of such amounts reported in Form MA(BS)3(III f).

derivative transactions, credit derivative contracts and SFTs.

12. Where an AI uses more than one internal ***rating system*** for an IRB class/subclass⁵, the AI should split the exposures into portfolios according to the internal rating systems used and report each portfolio in one form under Division B (and, where applicable, Division C). In addition, the AI should provide a brief description of the nature of the portfolio under the item “portfolio type” of each separate form. An AI should consult with the HKMA on the appropriate reporting treatment if it has difficulties to report its exposures by portfolio in the above manner.

V. Definitions and Clarification

(A) Definition of IRB Classes and Subclasses

Corporate Exposures

13. An AI should classify each of its exposures to corporates, including purchased corporate receivables, into one of the following IRB subclasses:
 - (i) ***specialized lending*** (SL) under ***supervisory slotting criteria approach*** (project finance) (see paragraphs 14 to 16);
 - (ii) SL under supervisory slotting criteria approach (***object finance***) (see paragraphs 14 to 16);
 - (iii) SL under supervisory slotting criteria approach (***commodities finance***) (see paragraphs 14 to 16);
 - (iv) SL under supervisory slotting criteria approach (***income-producing real estate***) (see paragraphs 14 to 16);
 - (v) Specialized lending (high-volatility commercial real estate) (see paragraphs 14 to 16);
 - (vi) small-and-medium sized corporates (SME corporates) (see paragraph 17); and
 - (vii) other corporates (see paragraph 18).

(a) SL

14. SL is a corporate exposure that possesses, unless specified otherwise, all of the following characteristics, either in legal form or economic substance:

⁵ For example, an AI may have more than one internal rating system for its qualifying revolving retail exposures, such as having separate scorecards for credit card lending and personal revolving loans.

- (i) the exposure is usually to a corporate (often a special purpose vehicle (SPV)) which has been created specifically to own and/or operate a specific asset (in other words, it has little or no other material assets or activities);
- (ii) the terms of the exposure give the AI (i.e. the lender) a substantial degree of control over the specific asset and the income which the specific asset generates; and
- (iii) the primary source of repayment of the exposure is the income generated by the specific asset (i.e. rather than other sources of income generated by the corporate).

15. There are five types of SL:-

- (i) Project finance (PF): PF refers to a method of funding in which an AI looks primarily to the revenue generated by a single project, both as the source of repayment of, and as collateral for, the exposure. PF is usually for large, complex and expensive installations that may include, for example, power plants, chemical processing plants, mines, transportation infrastructure, and telecommunications infrastructure. It may take the form of financing of the construction of a new capital installation, or refinancing of an existing installation, with or without improvements. The borrowing entity is usually an SPV established for the purpose of the project that is not permitted to perform any function other than developing, owning and operating the installation. The consequence is that repayment depends primarily on the project's cash flows (such as electricity sold by a power plant) and on the collateral value of the project's assets. In contrast, if repayment of the exposure depends primarily on a well established, diversified, credit-worthy and contractually obligated entity, the exposure should be treated as a collateralized exposure to that entity;
- (ii) Object finance (OF): OF refers to a method of funding the acquisition of physical assets (e.g. taxis, public light buses, ships, aircraft and satellites) where the repayment of the exposure is dependent on the cash flows generated by the assets that have been financed and pledged or assigned to an AI. A primary source of these cash flows may be rental or lease contracts with one or several third parties. In contrast, if the exposure is to a borrowing entity whose financial condition and debt-servicing capacity enables it to repay the debt without undue reliance on the specifically pledged assets, the exposure should be treated as a collateralized corporate exposure;
- (iii) Commodities finance (CF): CF refers to a structured short-term lending to finance reserves, inventories, or receivables of exchange-traded commodities (e.g. metals, energy or agricultural products), where the exposure will be repaid from the proceeds of the sale of the commodity and the borrowing entity has no other sources of income to repay the exposure. This is the case when the borrowing entity has no other activities and no other material assets on its balance sheet. The structured nature of the financing is designed to compensate for the weak credit quality of the borrowing entity. The rating of the exposure reflects its self-liquidating nature and the AI's skill in structuring the transaction rather than the credit quality of the borrowing entity. Such lending can be

distinguished from exposures financing the reserves, inventories, or receivables of other more diversified borrowing entities where the AI is able to rate the credit quality of these latter entities based on their broader ongoing operations. In such cases, the value of the commodity serves as a risk mitigant rather than as the primary source of repayment;

- (iv) Income-producing real estate (IPRE): IPRE refers to a method of funding to finance real estate (such as office buildings, retail shops, residential buildings, industrial or warehouse premises, and hotels) where the prospects for repayment and recovery on the exposure depend primarily on the cash flows generated by the asset. The primary source of these cash flows would generally be lease or rental payments or the sale of the asset. The borrowing entity may be, but is not required to be, an SPV, an operating company focused on real estate construction or holdings, or an operating company with sources of revenue other than real estate. The distinguishing characteristic of IPRE versus other corporate exposures that are collateralized by real estate is the strong positive correlation between the prospects for repayment of the exposure and the prospects for recovery in the event of default, with both depending primarily on the cash flows generated by a property; and
- (v) High-volatility commercial real estate (HVCRE): HVCRE is the financing of commercial real estate that exhibits a higher loss rate volatility (i.e. higher asset correlation) compared to other types of SL. **HVCRE exposures** include:
 - Commercial real estate exposures secured by any commercial real estate of a type that is categorized and announced by the MA or a relevant banking supervisory authority outside Hong Kong as sharing a higher volatility in portfolio default rate;
 - Commercial real estate exposures financing any of the land acquisition, development and construction phases (ADC phases) of commercial real estate of a type referred to above; and
 - Exposures financing the ADC phases of any other commercial real estate where the source of repayment at origination of the exposure is either the future uncertain sale of the commercial real estate or cash flows whose source of repayment is substantially uncertain (e.g. the commercial real estate has not yet been leased to the occupancy rate prevailing in that geographic market for that type of commercial real estate), and the borrowing entity in respect of the exposure does not have substantial equity at risk in the commercial real estate. **Specified ADC exposures** as defined under section 158(6) of the Rules, however, are ineligible for the preferential treatment set out in section 158(3) of the Rules.

Pursuant to section 143(4A) and (5)(ba) of the Rules, and unlike other types of SL, an AI's corporate exposures that meet the descriptions of HVCRE exposures above must be categorized into the IRB subclass of specialized lending (high-volatility commercial real estate) and are precluded from falling within any other IRB subclasses of corporate exposures (such as the IRB subclass of specialized lending (income-producing real estate)).

16. An AI that does not meet the requirements for ***PD*** estimation under the foundation IRB approach, or those for the estimation of PD, LGD and ***EAD*** and the calculation of ***M*** under the advanced IRB approach, for its SL should use the supervisory slotting criteria approach to derive the risk-weighted amount of such SL, by:
- (i) assigning the SL to internal grades based on its own rating criteria and map its internal grades to the five supervisory rating grades of “strong”, “good”, “satisfactory”, “weak” and “default” (see paragraph 75) by reference to the criteria specified in Annex 6 to the document entitled “International Convergence of Capital Measurement and Capital Standards – A Revised Framework (Comprehensive Version)” published by the Basel Committee on Banking Supervision in June 2006 or the ***credit quality grades*** specified in Schedule 8 of the Rules; and
 - (ii) complying with applicable requirements set out in section 158(2) of the Rules.

(b) SME corporates

17. In respect of an exposure to a corporate (other than HVCRE exposures) which has a reported total annual revenue (or a consolidated reported total annual revenue for the group of which the corporate is a part⁶) of less than HK\$500 million, an AI may classify the exposure under the IRB subclass of SME corporates. In the case where total annual revenue is not a meaningful indicator of the scale of business of a corporate, the MA may, on an exceptional basis, allow an AI to substitute the total assets for total annual revenue in applying the above threshold for that corporate. To ensure that the information used is timely and accurate, the AI should obtain the total annual revenue figures from the corporate’s latest audited financial statements⁷ and have the figures updated at least annually.

(c) Other corporates

18. An AI should classify all of its exposures to corporates which do not fall within any of the following IRB subclasses:
- (i) SL under supervisory slotting criteria approach (PF);
 - (ii) SL under supervisory slotting criteria approach (OF);
 - (iii) SL under supervisory slotting criteria approach (CF);

⁶ Where the corporate concerned is consolidated with other corporates by the AI for risk management purposes, the figure of the consolidated reported total annual revenue can be derived from the aggregate of the reported total annual revenue in the latest annual financial statements of the corporate concerned and the other corporates.

⁷ This does not apply to those customers that are not subject to statutory audit (such as a sole proprietorship). In such cases, an AI should obtain their latest available management accounts.

- (iv) SL under supervisory slotting criteria approach (IPRE);
 - (v) SL (high-volatility commercial real estate);
 - (vi) SME corporates;
 - (vii) residential mortgages (RM) to *property-holding shell companies* (see paragraph 25); and
 - (viii) small business retail exposures (see paragraph 27),
- as exposures under the IRB subclass of other corporates.

Sovereign Exposures

19. Sovereign exposures⁸ include exposures which fall within one of the following IRB subclasses:
- (i) sovereigns;
 - (ii) *sovereign foreign public sector entities* (SFPSEs); and
 - (iii) multilateral development banks (MDBs).

Bank Exposures

20. Bank exposures include exposures which fall within one of the following IRB subclasses:
- (i) banks;
 - (ii) *securities firms*; and
 - (iii) *public sector entities* (PSEs) that are not SFPSEs.

Retail Exposures

21. Exposures to individuals which, regardless of exposure size, are managed by an AI on a pooled or portfolio basis⁹ should be classified as retail exposures. Retail exposures to individuals usually include *residential mortgage loans* (RMLs), *revolving* credits (e.g. credit cards and overdrafts) and other personal loans (e.g. instalment loans, auto

⁸ Holdings of notes and coins should be reported as cash items under the IRB class of other exposures (see paragraph 33).

⁹ The MA does not intend to set the minimum number of retail exposures in a portfolio. An AI should establish its own policies to ensure the granularity and homogeneity of its retail exposures.

loans, tax loans, personal finance and other retail credits with similar characteristics). For those exposures which are not managed by an AI on a pooled or portfolio basis¹⁰, an AI should treat them as corporate exposures.

22. Exposures to corporates may also be classified as retail exposures, provided that the criteria set out in paragraph 27 are met.
23. An AI should classify each of its retail exposures, including purchased retail receivables, into one of the following IRB subclasses:
 - (i) RM to individuals (see paragraph 24);
 - (ii) RM to property-holding shell companies (see paragraph 25);
 - (iii) qualifying revolving retail exposures (QRRE) (see paragraph 26);
 - (iv) small business retail exposures (see paragraph 27); and
 - (v) other retail exposures to individuals (see paragraph 28).

(a) RM to individuals

24. RM to individuals refers to RMLs (including first and subsequent liens, term loans and revolving home equity lines of credit) that are extended to individuals, regardless of exposure size, and that the property secured for the loan is used, or intended for use, as the residence of the borrower or as the residence of a tenant, or a licensee, of the borrower.

(b) RM to property-holding shell companies

25. RM to property-holding shell companies refers to RMLs granted to property-holding shell companies on the condition that the credit risk of such loans is akin to those granted to individuals. This is considered to be the case where:
 - (i) the property securing the RML is used, or intended for use, as the residence of one or more than one director or shareholder of the property-holding shell company or as the residence of a tenant, or a licensee, of the property-holding shell company;
 - (ii) the RML granted to the property-holding shell company is fully and effectively covered by a personal **guarantee** entered into by one or more than one director or shareholder of the company (“the guarantors”);

¹⁰ This does not preclude retail exposures from being treated individually at some stages of the risk management process. The fact that an exposure is rated individually does not by itself preclude it from being eligible as a retail exposure.

- (iii) the AI is satisfied that the above guarantors are able to discharge their financial obligations under the guarantees, having due regard to their overall indebtedness; and
- (iv) the RML granted to the property-holding shell company has been assessed by reference to substantially similar credit underwriting standards (e.g. the loan purpose, loan-to-value ratio and debt-service ratio) as would normally be applied by the AI to an individual.

(c) QRRE

26. An AI should classify under the IRB subclass of QRRE a retail exposure that meets the following criteria:
- (i) the exposure is **revolving**, unsecured, and unconditionally cancellable (both contractually and in practice) by the AI;
 - (ii) the exposure is to one or more than one individual and not explicitly for business purposes;
 - (iii) the exposure is not more than HK\$1 million;
 - (iv) the exposure belongs to a **pool** of exposures which have exhibited, in comparison with other IRB subclasses of retail exposures, low loss rate volatility relative to the AI's average level of loss rates for retail exposures, especially within the pools to which low estimates of PD are attributed¹¹;
 - (v) data on loss rates for the QRRE portfolio(s) are retained by the AI in order to allow analysis of the volatility of loss rates; and
 - (vi) treatment of the exposure as QRRE is consistent with the underlying risk characteristics of the exposure.

(d) Small business retail exposures

27. An AI may classify its exposures to a corporate under the IRB subclass of small business retail exposures, provided that:
- (i) the total exposure of the AI or, where applicable, of its **consolidation group** to the corporate (or, where applicable, to the consolidated group of which the corporate is a part) is less than HK\$10 million¹²;

¹¹ This is because the correlation value (R) of the QRRE risk-weight formula is markedly below that of the risk-weight formula for other IRB subclasses of retail exposures, especially at low PD values.

¹² Small business credits extended through, or guaranteed by, an individual are subject to the same exposure threshold.

- (ii) the exposures are originated by the AI in a manner similar to retail exposures to individuals; and
- (iii) the exposures are managed by the AI on a pooled or portfolio basis in the same manner as retail exposures to individuals. In other words, they should not be managed individually in a way similar to corporate exposures, but rather as a portfolio segment or a pool of exposures with similar risk characteristics for the purposes of risk assessment and quantification.

(e) Other retail exposures to individuals

28. Other retail exposures to individuals include all retail exposures to individuals (see paragraph 21) which do not fall within the IRB subclass of:

- (i) RM to individuals (see paragraph 24); or
- (ii) QRRE (see paragraph 26).

Equity Exposures

29. An AI should consider the economic substance of an instrument in determining whether the instrument should be classified as an equity exposure. Equity exposures include both direct and indirect ownership interests (whether voting or non-voting) in a corporate¹³ where those interests are not consolidated or deducted for the purposes of calculating an AI's capital base. These instruments include:

- (i) holdings of any share issued by a corporate;
- (ii) holdings of any ***equity contract***;
- (iii) holdings in any ***collective investment scheme*** which is engaged principally in the business of investing in equity interests;
- (iv) holdings of any instrument which would be included in an AI's CET1 capital or Additional Tier 1 capital if the instrument were issued by the AI;
- (v) holdings of any instrument:
 - which is irredeemable in the sense that the return of the invested funds can be achieved only by the sale of the instrument or the sale of the rights to the instrument or by the liquidation of the issuer;
 - which does not embody an obligation on the part of the issuer (subject to item (vi)); and
 - which conveys a residual claim on the assets or income of the issuer;

¹³ For the purposes of categorizing exposures into the IRB class of equity exposures, corporate means a company, or a partnership or any other unincorporated body, that is not a public sector entity.

(vi) holdings of any instrument which embodies an obligation on the part of the issuer and in respect of which:

- the issuer may indefinitely defer the settlement of the obligation;
- the obligation requires (or permits at the issuer's discretion) settlement by the issuance of a fixed number of the issuer's equity shares;
- the obligation requires (or permits at the issuer's discretion) settlement by the issuance of a variable number of the issuer's equity shares and, other things being equal, any change in the value of the obligation is attributable to, comparable to, and in the same direction as, the change in the value of a fixed number of the issuer's equity shares¹⁴; or
- the AI, as the holder of the instrument, has the option to require that the obligation be settled in equity shares, unless the AI demonstrates to the satisfaction of the MA that: (a) in the case of a traded instrument, the instrument trades more like debt of the issuer than equity; or (b) in the case of a non-traded instrument, the instrument should be treated as a debt holding;

(vii) holdings of any debt obligation, share, *derivative contract*, investment scheme or instrument, which is structured with the intent of conveying the economic substance of equity interests¹⁵; and

(viii) any of the AI's liabilities on which the return is linked to that of equity interests.

30. An AI should not classify as equity exposures any equity holding which is structured with the intent of conveying the economic substance of debt holdings or securitization exposures. The MA may, on a case-by-case basis, require an AI to re-classify a debt holding as an equity exposure if the MA considers that the nature and economic substance of the debt holding are more akin to an equity exposure than a debt holding.

31. An AI adopting the IRB approach is required to classify each of its equity exposures booked in the banking book under one of the following IRB subclasses based on the method in use (i.e. the *market-based approach* or the *PD/LGD approach*) and, where applicable, the portfolio types:

(i) equity exposures under market-based approach (*simple risk-weight method*);

¹⁴ For certain obligations that require or permit settlement by the issuance of a variable number of the issuer's equity shares, the change in the monetary value of the obligation is equal to the change in the fair value of a fixed number of equity shares multiplied by a specified factor. Those obligations meet the conditions of this item if both the factor and the reference number of shares are fixed. For example, an issuer may be required to settle an obligation by issuing shares with a value equal to three times the appreciation in the fair value of 1,000 equity shares. That obligation is considered to be the same as an obligation that requires settlement by the issuance of shares equal to the appreciation in the fair value of 3,000 equity shares.

¹⁵ Equity interests that are recorded by an AI as a loan, but which arise from a debt/equity swap made as part of the orderly realization or restructuring of a debt should be classified as equity exposures. However, these exposures may not be allocated a lower risk-weight than would apply if such holdings had remained in the AI's debt portfolio.

- (ii) equity exposures under market-based approach (*internal models method*);
 - (iii) equity exposures under PD/LGD approach (publicly traded equity exposures held for long-term investment);
 - (iv) equity exposures under PD/LGD approach (privately owned equity exposures held for long-term investment);
 - (v) equity exposures under PD/LGD approach (other publicly traded equity exposures); and
 - (vi) equity exposures under PD/LGD approach (other equity exposures).
32. Equity exposures booked in the trading book are not subject to the IRB approach. Instead, these exposures should be subject to the *market risk* capital treatment and reported in Form MA(BS)3(IV).

Other Exposures

33. An AI should classify under the IRB class of other exposures any of its exposures which do not fall within the IRB class of corporate, sovereign, bank, retail or equity exposures. These exposures include:
- (i) *cash items*, the types of exposures covered are set out in the table under paragraph 134; and
 - (ii) *other items*, which are other exposures that do not fall within the IRB subclass of cash items, e.g. premises, plant and equipment and other fixed assets for own use (see paragraph 135).

(B) Clarification

34. Figures of percentage or year should be rounded up to two decimal points.
35. An AI should report in the columns of “Exposures before *recognized guarantees* / credit derivative contracts” the *EAD* of its on-balance sheet exposures and off-balance sheet exposures before adjusting for the credit risk mitigating effects of any recognized guarantee and *recognized credit derivative contract*. For instance:
- (i) in respect of on-balance sheet exposures, the AI should report the EAD of such exposures both before and after adjusting for the credit risk mitigating effects of any *recognized netting*;
 - (ii) in respect of off-balance sheet exposures (Other than OTC derivative transactions, credit derivative contracts and SFTs), the AI should report the *credit equivalent amount* of such exposures; and
 - (iii) in respect of off-balance sheet exposures (OTC derivative transactions, credit

derivative contracts and SFTs), the AI should report the default risk exposures of such transactions after adjusting for the credit risk mitigating effects of any recognized netting.

36. An AI should report in the columns of “Exposures after recognized guarantees / credit derivative contracts” the EAD of its on-balance sheet exposures and off-balance sheet exposures after adjusting for the credit risk mitigating effects of any recognized netting, recognized guarantee and recognized credit derivative contract.
37. ***Principal amount***, in respect of an off-balance sheet exposure, should be reported without deduction of ***specific provisions*** and partial write-offs.
38. Double counting of exposures arising from the same contract or transaction should be avoided. For example, only the undrawn portion of a corporate loan commitment should be reported as an off-balance sheet exposure in item 9 or 10 of Form IRB_OBSND and columns (7) and (10) of Form IRB_CSB while the actual amount drawn should be reported as an on-balance sheet exposure in columns (6) and (9) of Form IRB_CSB. Similarly, ***trade-related contingencies***, e.g. trust receipts and shipping guarantees for which the exposures have already been reported as letters of credit issued or loans against import bills etc., should not be reported under item 3 of Form IRB_OBSND and columns (7) and (10) of Form IRB_CSB.
39. In certain cases, credit exposures arising from OTC derivative transactions may have already been fully or partially reflected on the balance sheet. For example, an AI may have already recorded the ***current exposures*** to counterparties (i.e. ***mark-to-market*** values) under foreign exchange and interest rate related contracts on the balance sheet, typically as either sundry debtors or sundry creditors. To avoid double counting, such exposures should be excluded from on-balance sheet exposures and reported under the OTC derivative transactions for the purposes of this return.
40. The accrued interest of a credit exposure should form part of the EAD of the credit exposure. An AI should therefore classify and risk-weight the accrued interest receivables in the same way as the principal amount of the respective credit exposures.

Section B: Calculation of Risk-weighted Amount for Credit Risk under IRB Approach

I. Risk-weighted Amount under IRB Approach

41. The IRB approach to credit risk is based on measures of unexpected loss (UL) and *expected loss (EL)*. The *risk-weight functions* in this section produce capital requirements for the UL portion. EL is treated separately as outlined in section C.
42. An AI should calculate the risk-weighted amount for the UL of its credit exposures (excluding exposures that are subject to deduction from the AI's CET1 capital, Additional Tier 1 capital and Tier 2 capital, securitization exposures and exposures to CCPs) under the IRB approach as follows:
- (i) the AI should calculate the risk-weighted amount of each exposure (except equity exposures to which item (ii) applies and counterparty credit risk exposures to which item (iii) applies) by multiplying the EAD of each such exposure by the relevant risk-weight;
 - (ii) in respect of an equity exposure which is subject to the internal models method and for which the relevant minimum risk-weight (see paragraph 121(ii)) does not apply, the AI should calculate the risk-weighted amount by multiplying the potential loss of the exposure calculated under the internal models method by 12.5;
 - (iii) in respect of OTC derivative transactions, credit derivative contracts or SFTs, the AI must calculate the risk-weighted amount of the counterparty credit risk exposure -
 - (a) if the AI has an *IMM(CCR) approval*¹⁶ and an approval to use the *IMM approach*¹⁷ to calculate the *market risk capital charge* for specific risk for interest rate exposures, by aggregating -
 - the *IMM(CCR) risk-weighted amount* of the transactions or contracts concerned that are covered by the IMM(CCR) approval;
 - the *CEM risk-weighted amount*¹⁸ or *SFT risk-weighted amount*¹⁹ of the transactions or contracts concerned that are (i) not covered by the IMM(CCR) approval; or (ii) covered by the IMM(CCR) approval but fall within section 10B(5) or (7) of the Rules; and

¹⁶ The term "IMM(CCR)" in "IMM(CCR) approval" refers to the *internal models (counterparty credit risk) approach (IMM(CCR) approach)* - see definitions in section 2(1) of the Rules.

¹⁷ The term "IMM approach" refers to the *internal models approach* for the calculation of market risk - see definition in section 2(1) of the Rules.

¹⁸ The term "CEM" in "CEM risk-weighted amount" refers to the *current exposure method* - see definition in section 2(1) of the Rules.

¹⁹ See the definition of "SFT risk-weighted amount" in section 139(1) of the Rules.

- the CVA risk-weighted amount determined using the **advanced CVA method** (and reported in Division A of Form MA(BS)3(IIIff)), the **standardized CVA method** (and reported in Division B of Form MA(BS)3(IIIff)), or a combination of those 2 methods that is permitted under the Rules, as the case requires;
 - (b) if the AI has an IMM(CCR) approval but does not have an approval to use the IMM approach to calculate the market risk capital charge for specific risk for interest rate exposures, by aggregating -
 - the IMM(CCR) risk-weighted amount of the transactions or contracts concerned that are covered by the IMM(CCR) approval;
 - the CEM risk-weighted amount or SFT risk-weighted amount of the transactions or contracts concerned that are (i) not covered by the IMM(CCR) approval; or (ii) covered by the IMM(CCR) approval but fall within section 10B(5) or (7) of the Rules; and
 - the CVA risk-weighted amount determined using the standardized CVA method (and reported in Division B of Form MA(BS)3(IIIff)); and
 - (c) if the AI does not have an IMM(CCR) approval for any of its transactions or contracts, by aggregating -
 - the CEM risk-weighted amount;
 - the SFT risk-weighted amount; and
 - the CVA risk-weighted amount determined using the standardized CVA method (and reported in Division B of Form MA(BS)3(IIIff)); and
 - (iv) the AI should aggregate the risk-weighted amount figures derived from items (i), (ii) and (iii) (except the CVA risk-weighted amounts reported in Form MA(BS)3(IIIff)) and then apply a scaling factor (1.06) to the aggregate figure to arrive at the total risk-weighted amount for credit risk under the IRB approach.
43. For the purposes of paragraph 42(iii), an AI may, in the case of a default risk exposure in respect of **long settlement transactions** (LSTs), determine the exposure's relevant risk-weight using the STC approach on a permanent basis.
44. An AI must regard the total amount of the **CVA capital charge** for its counterparties determined in accordance with Division 3 of Part 6A of the Rules as the basis for determining the CVA risk-weighted amount of the AI as required under paragraph 42(iii), regardless of whether any of those counterparties falls within Part 6 of the Rules. That means the CVA risk-weighted amounts reported in Form MA(BS)3(IIIff) should be aggregated and reported in item 9 of Division A of Form MA(BS)3(IIIc).
45. An AI may reduce the risk-weighted amount of an exposure by taking into account the effect of any **recognized credit risk mitigation** through adjusting the PD, LGD or

EAD, as the case may be, in accordance with Part XIII of this section.

II. General Requirements for All IRB Classes

(A) General Requirements

46. There are three key elements for calculation of risk-weighted amount for the UL portion under the IRB approach, including:
- (i) credit risk components – these are estimates of PD, LGD, EAD, EL and M made by an AI, or *supervisory estimates* specified in the Rules;
 - (ii) risk-weight functions – these are the formulae by which credit risk components are transformed into risk-weighted amount and therefore capital requirements; and
 - (iii) minimum requirements - the minimum standards which an AI should meet for the use of the IRB approach²⁰.
47. An AI should use the risk-weight functions provided in this section for the purpose of calculating the risk-weighted amount, unless otherwise specified. In applying such risk-weight functions, PD and LGD are measured as decimals, EAD is measured in HK\$ and M is measured in years.
48. For the purposes of calculating the EAD of an exposure (whether held on- or off-balance sheet) that is measured at fair value, an AI should comply with the prudent valuation and valuation adjustment requirements in section 4A of the Rules.

(B) Corporate, Sovereign and Bank Exposures

49. Under the foundation IRB approach, an AI should provide its own estimates of PD associated with each of its *obligor grades*, but should use supervisory estimates for other credit risk components (i.e. LGD, EAD and M²¹).
50. Under the advanced IRB approach, an AI should provide its own estimates of PD, LGD and EAD and calculate M.
51. In respect of SL under supervisory slotting criteria approach (see paragraph 16), an AI should apply the supervisory estimate of a risk-weight that is applicable to a supervisory rating grade (see paragraph 75) in calculating the risk-weighted amount of such SL.

²⁰ Please refer to Part 6 and Schedule 2 of the Rules and the relevant supervisory policy/guidance relating to the IRB approach.

²¹ The use of explicit maturity adjustments is not required under the foundation IRB approach. Subject to the MA's prior consent, an AI having suitable systems for the calculation of M may be allowed to use explicit maturity adjustments under the foundation IRB approach.

(C) **Retail Exposures**

52. Under the ***retail IRB approach***, an AI should provide its own estimates of PD, LGD and EAD associated with each pool of retail exposures. There is no distinction between a foundation approach and an advanced approach for retail exposures.

(D) **Equity Exposures**

53. There are two approaches to calculating the risk-weighted amount of equity exposures held in the banking book: (i) the market-based approach and (ii) the PD/LGD approach²². Under the market-based approach, an AI may use the simple risk-weight method, the internal models method or a combination of both. However, for certain types of equity exposures that meet specified descriptions, a supervisory risk-weight applies to the relevant exposures irrespective of the calculation approaches the exposures are subject to (see paragraphs 119 and 120).

(E) **Other Exposures**

54. Under the ***specific risk-weight approach***, an AI should apply a specific risk-weight applicable to an exposure which falls within the IRB subclass of cash items (see paragraph 134) or the IRB subclass of other items (see paragraph 135) in calculating the risk-weighted amount of the exposure.

III. Specific Requirements for Certain Exposure Portfolios

(A) **Purchased Receivables**

55. Purchased receivables straddles corporate and retail IRB classes. For purchased corporate receivables, both the foundation IRB approach and the advanced IRB approach are available subject to the relevant minimum requirements being met. Like other retail exposures, there is no distinction between a foundation approach and an advanced approach for purchased retail receivables. For purchased receivables (whether corporate or retail), an AI is required to calculate the risk-weighted amount for default risk and, if material, ***dilution risk*** of such purchased receivables (see Part VIII of this section).

(B) **Leasing Transactions**

56. There is a distinct treatment for calculating the risk-weighted amount of exposures arising from leases with ***residual value risk*** (see Part IX of this section). Leases without any residual value risk will be accorded the same treatment as exposures collateralized by the underlying leased assets.

²² The PD/LGD approach to equity exposures remains available for an AI adopting the advanced IRB approach for its corporate, sovereign and bank exposures.

(C) **Securities Financing Transactions (SFTs)**

57. The calculation of the risk-weighted amount for SFTs depends on the economic substance of the transaction and whether the transaction is booked in the banking book or the trading book (see Part X of this section).

(D) **Credit-linked Notes**

58. The calculation of the risk-weighted amount for a *credit-linked note* depends on the risk-weight attributable to the *reference obligation* or basket of reference obligations of the note, the note issuer, and the AI's maximum liability under the note (see Part XI of this section).

IV. **Corporate, Sovereign and Bank Exposures**

(A) **Risk-weight Function for Derivation of Risk-weighted Amount**

59. The calculation of the risk-weighted amount of a corporate, sovereign or bank exposure is dependent on the estimates of PD, LGD, EAD and, in some cases, M, of a given exposure.

(a) Non-defaulted exposures

60. Subject to paragraph 77, for corporate, sovereign and bank exposures that are not in default (but excluding those treated as *hedged exposures* under the *double default framework*), the risk-weighted amount is calculated as follows^{23, 24}:

Correlation (R)

$$= 0.12 \times (1 - \text{EXP}(-50 \times \text{PD})) / (1 - \text{EXP}(-50)) + 0.24 \times [1 - (1 - \text{EXP}(-50 \times \text{PD})) / (1 - \text{EXP}(-50))]$$

Maturity adjustment (b)

$$= (0.11852 - 0.05478 \times \ln(\text{PD}))^2$$

Capital charge factor²⁵ (K)

$$= [\text{LGD} \times N[(1 - R)^{-0.5} \times G(\text{PD}) + (R / (1 - R))^{0.5} \times G(0.999)] - \text{PD} \times \text{LGD}]$$

²³ EXP denotes exponential and ln denotes the natural logarithm.

²⁴ N(x) denotes the cumulative distribution function for a standard normal random variable (i.e. the probability that a normal random variable with mean zero and variance of one is less than or equal to x). G(z) denotes the inverse cumulative distribution function for a standard normal random variable (i.e. the value of x such that N(x) = z). The normal cumulative distribution function and the inverse of the normal cumulative distribution function are, for example, available in Excel as the functions NORMSDIST and NORMSINV.

²⁵ If this calculation results in a negative capital charge for any individual sovereign exposure, an AI should apply a zero capital charge for that exposure.

$$x (1 - 1.5 \times b)^{-1} \times (1 + (M - 2.5) \times b)$$

$$\text{Risk-weight (RW)} = K \times 12.5$$

$$\text{Risk-weighted amount} = \text{RW} \times \text{EAD}$$

(Illustrative risk-weights are shown in **Annex IIIc-C**.)

(b) Defaulted exposures

61. An AI should use the same risk-weight function set out in paragraph 60 to calculate the risk-weighted amount of its corporate, sovereign and bank exposures which are in default (i.e. a default of the obligor in respect of the exposure has occurred by virtue of section 149(1) or (5A) of the Rules), except that the capital charge factor (K) for a defaulted corporate, sovereign or bank exposure should be equal to the greater of:
- (i) zero; or
 - (ii) the figure resulting from the subtraction of the AI's best estimate of the EL²⁶ from the LGD of the defaulted exposure.

(c) Hedged exposures under double default framework

62. For any hedged exposure under the double default framework (see paragraphs 219 and 220), the risk-weighted amount is calculated as below:

Correlation (ρ_{os})

$$= 0.12 \times (1 - \text{EXP}(-50 \times \text{PD}_o)) / (1 - \text{EXP}(-50)) + 0.24 \times [1 - (1 - \text{EXP}(-50 \times \text{PD}_o)) / (1 - \text{EXP}(-50))]$$

Maturity adjustment (b_{os})

$$= (0.11852 - 0.05478 \times \ln(\text{PD}_{os}))^2$$

Capital charge factor (K_{DD})

$$= \left\{ \text{LGD}_g \times \left[N \left(\frac{G(\text{PD}_o) + \sqrt{\rho_{os}} \times G(0.999)}{\sqrt{1 - \rho_{os}}} \right) - \text{PD}_o \right] \times \frac{1 + (M_{os} - 2.5) \times b_{os}}{1 - 1.5 \times b_{os}} \right\} \times (0.15 + 160 \times \text{PD}_g)$$

$$\text{Risk-weight (RW}_{DD}) = K_{DD} \times 12.5$$

$$\text{Risk-weighted amount} = \text{RW}_{DD} \times \text{EAD}_g$$

where:

PD_o = PD of the underlying **obligor** without taking into account the effect of **credit protection** (see paragraph 80)

²⁶ With the prior consent of the MA, an AI which uses the foundation IRB approach may use the supervisory estimate for the LGD as the EL for its corporate, sovereign and bank exposures which are in default.

- PD_g = PD of the **credit protection provider** of the hedged exposure (see paragraph 80)
 PD_{os} = The lower of PD_o and PD_g
 M_{os} = M of the credit protection (see paragraph 107)
 LGD_g = LGD of a comparable direct exposure to the credit protection provider (see paragraphs 98 and 99)
 EAD_g = EAD of the hedged exposure

63. Defaulted exposures cannot be subject to the double default framework. In case the underlying obligor of a hedged exposure defaults, such exposure should be treated as a direct exposure to the credit protection provider and then risk-weighted accordingly. Conversely, if the credit protection provider of a hedged exposure defaults, such exposure should remain with the underlying obligor and should be risk-weighted as an **unhedged exposure** to the underlying obligor. In case both the underlying obligor and the credit protection provider of a hedged exposure default, such exposure should be treated as a defaulted exposure to either the underlying obligor or the credit protection provider, depending on which party defaulted last.

(d) OTC derivative transactions and credit derivative contracts - Full maturity adjustment

64. Where an AI that uses the advanced CVA method to calculate its CVA capital charge demonstrates to the satisfaction of the MA that its **VaR** model used in the advanced CVA method adequately covers the effects of rating migrations, the institution may—
- (i) calculate the risk-weight applicable to a default risk exposure in respect of OTC derivative transactions or credit derivative contracts under paragraph 60 with the **full maturity adjustment** set equal to 1; and
 - (ii) calculate the risk-weight applicable to a default risk exposure in respect of OTC derivative transactions or credit derivative contracts under paragraph 62 with the full maturity adjustment set equal to 1 but the credit protection provider must be one of the counterparties covered by the CVA capital charge calculation.
65. The term “full maturity adjustment” in paragraph 64(i) and (ii) means -
- (i) that amount calculated by the component $(1 - 1.5 \times b)^{-1} \times (1 + (M - 2.5) \times b)$ in Formula 16 of the Rules (see paragraph 60); or
 - (ii) that amount calculated by the component $\frac{1 + (M_{os} - 2.5) \times b_{os}}{1 - 1.5 \times b_{os}}$ in Formula 17 of the Rules (see paragraph 62),
- as the case requires.

(e) SME corporates - Firm-size adjustment

66. An AI using the IRB approach is permitted to separately distinguish its corporate exposures as SME corporates as defined in paragraph 17. For these SME corporate exposures, a firm-size adjustment (i.e. $0.04 \times (1 - (S-50) / 450)$) must be applied to the relevant risk-weight function as set out in paragraph 60 or 62, as the case requires, for the calculation of the correlation value:

- (i) Exposures to SME corporates that are not subject to the double default framework

Correlation (R)

$$= 0.12 \times (1 - \text{EXP}(-50 \times \text{PD})) / (1 - \text{EXP}(-50)) + 0.24 \times [1 - (1 - \text{EXP}(-50 \times \text{PD})) / (1 - \text{EXP}(-50))] - 0.04 \times (1 - (S - 50) / 450)$$

- (ii) Exposures to SME corporates that are subject to the double default framework

Correlation (ρ_{os})

$$= 0.12 \times (1 - \text{EXP}(-50 \times \text{PD}_o)) / (1 - \text{EXP}(-50)) + 0.24 \times [1 - (1 - \text{EXP}(-50 \times \text{PD}_o)) / (1 - \text{EXP}(-50))] - 0.04 \times (1 - (S - 50) / 450)$$

where S is expressed as the total annual revenue of the SME corporate (or the consolidated total annual revenue of the group of which the SME corporate is a member²⁷) in millions of HK\$ with the value of S falling in the range from HK\$50 million to HK\$500 million. Total annual revenue of less than HK\$50 million will be deemed as equivalent to HK\$50 million for the purpose of the firm-size adjustment. In the case where total annual revenue does not accurately reflect a corporate's scale of business, the MA may, on an exceptional basis, allow an AI to substitute the corporate's total assets for the total annual revenue in calculating the firm-size adjustment for the SME corporate.

(f) Exposures to certain financial institutions – Correlation adjustment by way of asset value correlation multiplier

67. For an AI's corporate, sovereign or bank exposure to an obligor that is (i) a **large regulated financial institution**; or (ii) a **financial institution** that is not supervised by a **financial regulator**, the AI must multiply the correlation (R) or correlation (ρ_{os}) in the risk weight function set out in paragraph 60 or 62, as the case requires, by 1.25.
68. For the purposes of paragraph 67,
- “financial institution” means an entity that-
 - (a) is a **financial sector entity**; or

²⁷ An AI should treat a SME corporate and other corporates which are consolidated by the AI for risk management purposes as a consolidated group.

- (b) is engaged predominantly in any one or more of the following activities, whether by itself or through any of its subsidiaries—
 - (i) lending;
 - (ii) factoring;
 - (iii) provision of credit enhancement;
 - (iv) securitization;
 - (v) proprietary trading;
 - (vi) any other financial services activity specified in Part 11 of Schedule 1 of the Rules;
 - “financial regulator” means a regulatory authority that imposes supervisory standards (including supervisory standards relating to capital and liquidity) that are substantially consistent with international standards;
 - “large regulated financial institution” means a financial institution that is supervised by a financial regulator and that—
 - (a) has total assets of not less than HK\$780 billion as determined by reference to the institution’s most recent audited consolidated financial statements or (if the institution does not have any subsidiary) the institution’s most recent audited financial statements; or
 - (b) is a member of a group of companies (comprised of the ultimate holding company²⁸ and all of its subsidiaries) that has total assets of not less than HK\$780 billion as determined by reference to the group’s most recent audited consolidated financial statements.
69. To ensure that the information used for determining whether a financial institution is a large regulated financial institution is timely and accurate, the AI should obtain the total assets figures from the latest audited financial statements of the financial institution or its wider group, as the case requires, and have the figures updated at least annually.
70. For the avoidance of doubt, if an SME corporate that is subject to the firm-size adjustment mentioned in paragraph 66 is also a financial institution to which the asset value correlation multiplier requirements mentioned in paragraph 67 apply, an AI should apply the adjustments mentioned in both paragraphs to the correlation (R) or correlation (ρ_{os}) in the risk-weight function set out in paragraph 60 or 62, as the case requires.

²⁸ There could be many forms and levels of consolidation in respect of a group of companies. To avoid any arbitrary specification, the HKMA intends to leverage on the consolidation requirements prescribed by generally acceptable accounting standards applicable to the financial groups. For the purposes of determining the total assets of the wider group of a financial institution under the definition of “large regulated financial institution”, the top-most holding company included in the highest level of audited consolidated financial statements of a financial group (which comprises an ultimate holding company and all of its subsidiaries) should be regarded as the “ultimate holding company”.

(g) SL

71. The capital treatments set out in this subsection apply to all types of SL (see paragraph 15) unless otherwise specified.
72. An AI that meets the requirements for PD estimation under the IRB approach for its SL should use the foundation IRB approach (or the advanced IRB approach, where the AI can also provide the estimates of other credit risk components) to calculate the risk-weighted amount for such SL, based on the relevant risk-weight functions set out in paragraphs 59 to 70.
73. The use of the foundation IRB approach or the advanced IRB approach by an AI in respect of its HVCRE exposures is subject to the additional requirements set out in section 158(1A), (1B) and (1C) of the Rules, as highlighted below:-
- (i) The value of the asset correlation factor of 0.24 in the correlation (R or ρ_{os}) in the risk-weight functions mentioned in paragraphs 60 and 62 must be replaced by a value of 0.30, and this must remain the case both before and after any adjustment is made to R or ρ_{os} pursuant to section 157(5) or 157A of the Rules (see paragraphs 67 and 74).
 - (ii) If an AI has material IPRE exposures (i.e. the average aggregate EAD of its reference exposures²⁹ over the past 12 months exceeds 5% of its capital base as determined under Part 3 of the Rules), it must not use the advanced IRB approach in respect of its HVCRE exposures unless the AI also uses the advanced IRB approach to derive the risk-weighted amount of all of its IPRE exposures.
 - (iii) For an AI that started to use the advanced IRB approach for its HVCRE exposures at a time when it did not have any material IPRE exposures but which:
 - (a) subsequently becomes aware that it has material IPRE exposures; and
 - (b) does not also use the advanced IRB approach to derive the risk-weighted amount of all of its reference exposure²⁹,the AI must cease to use the advanced IRB approach in respect of its HVCRE exposures after the expiry of a period of 6 months after the date on which the AI became so aware, unless the AI begins to use the advanced IRB approach for all of its reference exposures²⁹ within that 6-month period.
74. Subject to paragraph 73, an AI may make a firm-size adjustment as described in paragraph 66 to an HVCRE exposure that meets the size criteria for SME corporates set out in paragraph 17.
75. In respect of SL under supervisory slotting criteria approach, an AI should apply the risk-weight specified in the table below for the relevant supervisory rating grade to which a SL is assigned in calculating the risk-weighted amount of that SL.

²⁹ Please see the definition of “*reference exposure*” under section 158(6) of the Rules for the various sources of IPRE exposures of AIs for this purpose.

	Strong	Good	Satisfactory	Weak	Default
<u>A. SL (other than HVCRE exposures)</u>					
(i) Remaining maturity of less than 2.5 years	50%	70%	115%	250%	0%
(ii) Remaining maturity of equal to or more than 2.5 years	70%	90%	115%	250%	0%
<u>B. HVCRE exposures</u>					
(i) Remaining maturity of less than 2.5 years	70%	95%	140%	250%	0%
(ii) Remaining maturity of equal to or more than 2.5 years	95%	120%	140%	250%	0%

76. An AI may assign a preferential risk-weight of –

- (a) 50% to “strong” exposures and 70% to “good” exposures, as set out in row A(i) of the table above, in respect of its SL (other than HVCRE exposures and specified ADC exposures); and
- (b) 70% to “strong” exposures and 95% to “good” exposures, as set out in row B(i) of the table above, in respect of its HVCRE exposures,

provided that the SL has a remaining maturity of less than 2.5 years, or the AI demonstrates to the satisfaction of the MA that the AI’s credit underwriting criteria and the ability of the obligor in respect of the SL to withstand other risk characteristics are substantially stronger than the corresponding criteria for the equivalent supervisory rating grade as described in paragraph 16(i).

(h) LSTs arising from OTC derivative transactions, credit derivative contracts and SFTs

77. An AI may calculate the risk-weighted amount of the default risk exposure in respect of LSTs by multiplying the EAD of the exposure by the relevant risk-weight attributable to that exposure determined under the STC approach in accordance with Part 4 of the Rules. However, the positions of such exposures should still be reported in Form MA(BS)3(IIIc).

(B) Credit Risk Components

Probability of Default (PD)

78. For its corporate, sovereign and bank exposures, an AI should rate on an individual basis each legal entity to which the AI is exposed. In assigning a PD to individual obligors in a connected group, an AI may assign the same obligor grade in respect of exposures to these obligors (such an obligor grade reflects the benefits of group support in accordance with the established policy of the AI and is thus likely to be more favourable than if the individual obligors are rated on a standalone basis), provided the requirements of section 154(d) of the Rules are met. An AI is also required to set out in policies and put into operation a process for the identification of *specific wrong-way risk* for each legal entity to which the AI is exposed.
79. For corporate³⁰ and bank exposures, the PD of an exposure is the greater of the PD associated with the internal obligor grade to which that exposure is assigned, or 0.03%.
80. Under the double default framework, PD_o and PD_g (see paragraph 62) are the PD associated with the internal obligor grade of the underlying obligor and the credit protection provider, respectively, and both are also subject to the PD floor of 0.03%.
81. For sovereign exposures, the PD of an exposure is the PD associated with the internal obligor grade to which that exposure is assigned (i.e. without any PD floor).
82. For corporate, sovereign and bank exposures, the PD of an exposure assigned to a default grade (i.e. a default of the obligor in respect of the exposure has occurred by virtue of section 149(1) or (5A) of the Rules) is 100%.
83. When estimating the PD for an obligor that is highly leveraged or whose assets are predominantly traded assets, ensure such estimate reflects the performance of the obligor's assets based on volatilities calibrated to data from periods of significant financial stress. Forms and measures of leverage have proliferated, and will continue to evolve, as a result of financial innovation (in terms of products and trading strategies) and changes in market sentiment. While markets can, and apparently do, have a prevailing "sense" of which counterparties are regarded as "highly leveraged" (e.g. hedge funds and other equivalently highly leveraged financial sector entities), it appears that no market consensus has yet been reached on specific set(s) of definitive quantitative criteria for determining whether a counterparty is highly leveraged. AIs should therefore make their own judgement on whether an obligor should be considered "highly leveraged" in a prudent and consistent manner, having regard to the risk characteristics of their obligors and prevailing market perceptions of them as well as the nature of the markets in which they operate. A similar approach could be deployed in determining whether the assets of a particular counterparty are "predominantly" traded assets.

³⁰ In estimating the PD of a holding company which has both consolidated and unconsolidated (i.e. company level) financial statements, an AI should assess the financial strength of the company on both bases. If these two bases suggest two different PDs, the AI should use the higher one.

Loss Given Default (LGD)

84. An AI should provide an estimate of the LGD for each corporate, sovereign and bank exposure. There are two approaches for deriving this LGD estimate: the foundation IRB approach or the advanced IRB approach.

LGD under foundation IRB approach

(a) Treatment of exposures which are unsecured or secured by non-recognized collateral under foundation IRB approach

85. Subject to paragraphs 87 and 88, for corporate, sovereign and bank exposures, a senior exposure³¹ that is unsecured or secured by a non-recognized collateral should be assigned a LGD of 45%.
86. Subject to paragraphs 87 and 88, for corporate, sovereign and bank exposures, a subordinated exposure³² should be assigned a LGD of 75%.

(b) Treatment of transactions with specific wrong-way risk under foundation IRB approach

87. For default risk exposures in respect of single-name credit default swaps, where the swaps fall within section 226J(1) of the Rules and those exposures are determined in accordance with section 226J(3) of the Rules, the exposures should be assigned a supervisory estimate of 100% for the LGD.
88. For default risk exposures in respect of transactions that fall within section 226J(4) of the Rules, the exposures should be assigned a supervisory estimate of 100% for the LGD if the AI has the MA's approval to calculate **incremental risk charge** for the transactions and the determination of the default risk exposures under that section has used existing calculations for incremental risk charge that already contain an LGD assumption.

(c) Recognized collateral under foundation IRB approach

89. The following collateral can be recognized for senior exposures under the foundation IRB approach:
- (i) **recognized financial collateral** –
- includes any collateral which can be recognized under the **comprehensive**

³¹ A senior exposure means an exposure to an obligor which is not a subordinated exposure.

³² A subordinated exposure means an exposure to an obligor which is lower in ranking, or junior, to other claims against the obligor in terms of the priority of repayment or which will be repaid only after all the senior claims against the obligor have been repaid.

approach³³ to the treatment of collateral under the STC approach;

- but does not include any collateral in the form of real property, or any collateral in the form of debt securities that would fall within the definition of re-securitization exposure in section 2(1) of the Rules if treated as an on-balance sheet exposure; and

(ii) **recognized IRB collateral** – these include:

- financial receivables which fall within section 205 of the Rules (recognized financial receivables);
- commercial real estate (recognized CRE) and residential real estate (recognized RRE) which fall within section 206 or 208 of the Rules; and
- physical assets (other than recognized CRE or recognized RRE) which fall within section 207 or 208 of the Rules (other recognized IRB collateral).

(d) **Methodology for recognition of recognized financial collateral under foundation IRB approach**

90. The methodology for recognition of recognized financial collateral closely follows the comprehensive approach under the STC approach. The effective LGD (LGD*) applicable to a senior exposure with recognized financial collateral is expressed as follows:

$$\text{LGD}^* = \text{LGD} \times (\text{E}^* / \text{E})$$

Where:

LGD = The supervisory estimate of the LGD specified in paragraph 85, 87 or 88, as the case may be, before recognition of recognized financial collateral

E = EAD of the exposure

E* = Net credit exposure (being the EAD of the exposure after recognition of recognized financial collateral³⁴)

91. E* is calculated as follows:

$$\text{E}^* = \max \{0, [\text{E} \times (1 + \text{H}_e) - \text{C} \times (1 - \text{H}_c - \text{H}_{fx})]\}$$

Where:

H_e = **Haircut** applicable to the exposure pursuant to the **standard**

³³ The simple approach to the treatment of collateral under the STC approach is not available to an AI applying the IRB approach.

³⁴ This concept is only applied to the calculation of LGD*. An AI should continue to calculate EAD without taking into account the presence of any collateral, unless otherwise specified.

supervisory haircuts for the comprehensive approach to treatment of recognized collateral subject to adjustment as set out in section 92 of the Rules

- C = Current market value of recognized financial collateral before adjustment required by the comprehensive approach to treatment of recognized collateral
- H_c = Haircut applicable to recognized financial collateral pursuant to the standard supervisory haircuts for the comprehensive approach to treatment of recognized collateral subject to adjustment as set out in section 92 of the Rules
- H_{fx} = Haircut applicable in consequence of a **currency mismatch** (if any) pursuant to the standard supervisory haircuts for the comprehensive approach to treatment of recognized collateral subject to adjustment as set out in section 92 of the Rules

In calculating the net credit exposure (E*), haircuts should be applied to the value of the exposure (H_e) and the value of the collateral (H_c) for any possible future price fluctuations. Where there is a currency mismatch between the exposure and the collateral, a further haircut (H_{fx}) should be applied to the collateral to provide allowance for any possible fluctuation in exchange rates. An AI should refer to Annex IIIb-E of the completion instructions of Form MA(BS)3(IIIb) which sets out the standard supervisory haircuts and the circumstances requiring a haircut adjustment (i.e. based on the frequency of remargining or revaluation) under the comprehensive approach. Where there is **maturity** mismatch between the exposure and the collateral, the AI should adjust the value of the collateral in accordance with paragraphs 230 to 232.

92. As in the STC approach, a 0% haircut is applied to repo-style transactions that are treated as collateralized loans to the counterparty if the criteria for the preferential treatment under the comprehensive approach as set out in Annex IIIb-D of the completion instructions of Form MA(BS)3(IIIb) are satisfied.

(e) Methodology for recognition of recognized IRB collateral under foundation IRB approach

93. The methodology for determining the LGD* of a senior exposure under the foundation IRB approach for cases where an AI has taken recognized IRB collateral is set out as follows:
- (i) exposures where the ratio of the current market value of the collateral received (C) to the EAD of the exposure (E) is below a threshold level of C* (i.e. the required minimum collateralization level for the exposure) will be treated as an unsecured exposure subject to a LGD specified in paragraph 85, 87 or 88, as the case may be; and
 - (ii) exposures where the ratio of (C) to (E) exceeds another threshold level of C** (i.e. the required level of over-collateralization for full LGD recognition) will be assigned a LGD according to the table below:

Recognized IRB collateral	Supervisory estimate of LGD	Required minimum collateralization for partial recognition (C*)	Required level of over-collateralization for full recognition (C**)
Recognized financial receivables	35%	0%	125%
Recognized CRE/RRE	35%	30%	140%
Other recognized IRB collateral	40%	30%	140%

94. Under the foundation IRB approach, if the ratio of C to E of a senior exposure exceeds a threshold of level C* but not a threshold of level C**, the LGD* for the collateralized and uncollateralized portions of the exposure is determined as follows:

- (i) the part of the exposure considered to be fully collateralized (i.e. C/C**) receives the LGD associated with the type of collateral according to the table in paragraph 93; and
- (ii) the remaining part of the exposure is regarded as uncollateralized (i.e. E - C/C**) and receives a LGD specified in paragraph 85, 87 or 88, as the case may be.

(f) Methodology for recognition of pools of recognized collateral under foundation IRB approach

95. The methodology for determining the LGD* of an exposure under the foundation IRB approach for cases where an AI has taken both recognized financial collateral and recognized IRB collateral is aligned with the treatment in the STC approach and based on the following guidance:

- (i) where an AI has obtained multiple forms of collateral recognized under the foundation IRB approach for an exposure, the AI should divide the exposure into:
 - the portion fully collateralized by recognized financial collateral (after taking into account various haircuts and the adjustment for maturity mismatch in determining the value of the recognized financial collateral);
 - the portion fully collateralized by recognized financial receivables;
 - the portion fully collateralized by recognized CRE/RRE;
 - the portion fully collateralized by other recognized IRB collateral;
 - the portion, if any, which is uncollateralized.
- (ii) where the ratio of the sum of the current market value of recognized CRE/RRE and other recognized IRB collateral to the remaining EAD of the exposure (i.e.

after taking into account the credit risk mitigating effect of recognized financial collateral and recognized financial receivables) is below the threshold level C* (i.e. 30%), the AI should assign a LGD specified in paragraph 85, 87 or 88, as the case may be, to the remaining exposure.

- (iii) the AI should calculate the risk-weighted amount of each fully secured portion of exposure separately.

LGD under Advanced IRB Approach

- 96. Except for the exposures specified in paragraph 97, an AI using the advanced IRB approach is allowed to use its own internal estimates of LGD for corporate, sovereign and bank exposures. The LGD should be measured as a percentage of the EAD.
- 97. For a facility type that comprises default risk exposures in respect of single-name credit default swaps that fall within the description of paragraph 87 or transactions that fall within the description of paragraph 88, an AI must comply with the requirements of the applicable paragraph as if the institution were an AI that uses the foundation IRB approach.

LGD under Double Default Framework

- 98. For the purposes of calculating the risk-weighted amount of hedged exposures under the double default framework, LGD_g is the LGD of a comparable direct exposure to the credit protection provider (see paragraph 62). That means, LGD_g will be the LGD of the exposure to the credit protection provider or an ***unhedged exposure*** to the underlying obligor, depending upon whether in the event both the credit protection provider and the underlying obligor default during the life of the hedged exposure, available evidence and the structure of the guarantee/credit derivative contract indicate that the amount recovered would depend on the financial condition of the credit protection provider or the underlying obligor, as the case may be.
- 99. In estimating the LGD_g , an AI may recognize collateral provided exclusively against the exposure or the guarantee/credit derivative contract respectively. There should be no consideration of double recovery in the LGD estimate.

Exposure at Default (EAD)

- 100. The EAD of an exposure is measured without deduction of specific provisions and partial write-offs.
- 101. In relation to an on-balance sheet exposure, an AI should use the current drawn amount of the exposure (for an exposure that is measured at fair value, the current drawn amount is the value determined in accordance with section 4A of the Rules), after taking into account the credit risk mitigating effect of any recognized netting (see Part XIII of this section), as an estimate of the EAD of the exposure such that the EAD of the exposure is not less than the sum of:

- (i) the amount by which the AI's CET1 capital would be reduced if the exposure were fully written-off; and
- (ii) any specific provisions and partial write-offs in respect of the exposure.

Where the amount by which an AI's estimate of EAD in respect of an exposure exceeds the sum of items (i) and (ii) of the exposure, this amount is termed a discount. The calculation of the risk-weighted amount should be independent of any discounts. In calculating the eligible provisions for the purpose of the EL-eligible provisions calculation as set out in Section C, any discounts attributed to defaulted exposures should be included.

102. In relation to the calculation of EAD of off-balance sheet exposures, an AI should refer to Part XII of this section.

Effective Maturity (M)

(a) M under foundation IRB approach

103. For an AI using the foundation IRB approach for corporate, sovereign and bank exposures, M will be 2.5 years except for repo-style transactions where M will be 6 months³⁵.

(b) M under advanced IRB approach

104. An AI using the advanced IRB approach for corporate, sovereign and bank exposures is required to calculate M for each exposure. Subject to paragraph 105, M is defined as the greater of one year or the remaining effective maturity, in years, of the exposure as defined below:

- (i) subject to items (ii), (iii) and (iv), for an exposure subject to a predetermined cash flow schedule, M is defined as:

$$M = \sum_t t * CF_t / \sum_t CF_t$$

where CF_t denotes cash flows (including principal, interest payments and fees) contractually payable by the obligor in period t. Period t is expressed in years (that is, where a payment is due to be received in 18 months, $t = 1.5$);

- (ii) if the exposure is a default risk exposure in respect of a **netting set** calculated using the IMM(CCR) approach and the original maturity of the longest-dated

³⁵ With the prior consent of the MA, an AI using the foundation IRB approach may calculate M for each exposure in accordance with paragraphs 104 to 106 if the AI can demonstrate that it has adequate systems for doing so.

contract contained in the netting set is greater than one year, the M of the exposure is calculated by:

$$M = \frac{\sum_{k=1}^{t_k \leq 1 \text{ year}} \text{Effective EE}_k \times \Delta t_k \times df_k + \sum_{t_k > 1 \text{ year}}^{maturity} EE_k \times \Delta t_k \times df_k}{\sum_{k=1}^{t_k \leq 1 \text{ year}} \text{Effective EE}_k \times \Delta t_k \times df_k}$$

Where –

- df_k is the risk-free discount factor for future time period t_k ;
- Effective EE_k = effective EE at time t_k calculated in accordance with section 226G of the Rules;
- $maturity$ = the time when the transaction which has the longest residual maturity in the netting set matures; and
- $\Delta t_k = t_k - t_{k-1}$ is the time interval between t_k and t_{k-1} when EE is calculated at dates that are not equally spaced over time;

(iii) subject to item (iv),

- if the exposure is a default risk exposure in respect of a netting set calculated using the IMM(CCR) approach and all the transactions in the netting set have an original maturity of not more than one year, the effective maturity of each transaction in the netting set is calculated by the use of the formula under item (i), and the effective maturity of the netting set is calculated as the weighted average effective maturity of the transactions (using the **notional amount** of each transaction for weighting the maturity of the transactions within the netting set); and
- if the netting set referred to in the bullet above contains only one transaction, the M of the exposure is calculated by the use of the formula under item (i);

(iv) if it is not practicable for an AI to calculate M of the contracted payments in accordance with item (i) or (iii), the AI should use a more prudent measure of M which is not less than the maximum remaining time, in years, that the obligor is permitted to take to fully discharge its contractual obligations (including principal payments, interest payments and fees) under the terms of the agreement governing the exposure. This usually corresponds to the nominal maturity of the exposure; and

(v) subject to items (ii) and (iii), if an exposure is a net credit exposure resulting from the netting of more than one **nettable** OTC derivative transaction or credit derivative contract, the weighted average maturity of the transactions or contracts (using the notional amount of each transaction or contract for weighting the maturity of the transactions or contracts) subject to a **valid bilateral netting agreement** is used as the M but the M must be not less than one year.

In all cases, M will be no greater than five years.

105. The one-year floor does not apply to the following exposures:

- (i) fully or almost fully collateralized capital market-driven transactions (i.e. OTC derivative transactions, credit derivative contracts or margin lending transactions), or repo-style transactions with an original maturity of less than one year, where the documentation for the transaction or contract contains clauses requiring daily revaluation or re-margining and allowing for the prompt realization or set-off of the collateral in the event of default or failure to revalue or re-margin, as the case may be; and
- (ii) exposures with an original maturity of less than one year which are not part of an AI's ongoing financing (i.e. there being no intent or legal obligation to roll over the exposure concerned in the future) of the obligor. These exposures include:
 - short-term self-liquidating trade transactions (such as an import or export letter of credit, or any similar transaction, which can be accounted for at its actual remaining maturity);
 - securities purchases or sales, cash settlement by wire transfer, foreign exchange settlement, or any other exposures arising from unsettled transactions that are entered into on a basis other than a delivery-versus-payment basis, provided that such exposures do not continue for five *business days* or more after the settlement date; and
 - any other short-term exposures that an AI demonstrates to the satisfaction of the MA that the AI has no intent or legal obligation to roll over such exposures and will not, in practice, roll over the exposures.

M of these exposures is calculated as the greater of one day or that measured in accordance with paragraph 104(i) or (iv).

106. Where an exposure of an AI is in respect of a netting set in which all the transactions or contracts fall within the description in paragraph 105(i) :

- (i) subject to items (ii) and (iii), the AI must calculate the M of the exposure in accordance with paragraph 104(v) except that the M need not be equal to or greater than one year;
- (ii) subject to item (iii), if the exposure is a default risk exposure calculated using the IMM(CCR) approach, the AI must calculate the M in accordance with paragraph 104(iii) except that the M need not be equal to or greater than one year; and
- (iii) in determining the M, the AI must apply a minimum level of M equal to –

- (a) 10 days for a netting set that contains OTC derivative transactions, credit derivative contracts or margin lending transactions;
- (b) 5 days for a netting set that contains repo-style transactions; and
- (c) 10 days for a netting set that contains transactions or contracts that fall within both items (a) and (b).

(c) M under the double default framework

107. For hedged exposures that are subject to the double default framework, M_{os} of the exposure should be the greater of:
- (i) one year; or
 - (ii) the M of the credit protection in respect of the hedged exposure as calculated in accordance with paragraph 104.

V. Retail Exposures

(A) Risk-weight Function for Derivation of Risk-weighted Amount

108. There are three separate risk-weight functions for retail exposures as set out in paragraphs 109 to 111. The risk-weights for retail exposures are based on separate assessments of PD and LGD as inputs to the risk-weight functions. The calculation of the risk-weighted amount for retail exposures does not require the input of M.

(a) Non-defaulted exposures

RM

109. For retail exposures which fall within the IRB subclass of RM to individuals (see paragraph 24) or RM to property-holding shell companies (see paragraph 25) that are not in default (whether secured or partially secured³⁶), the risk-weighted amount is calculated as follows:

Correlation (R) = 0.15

Capital charge factor (K)

= $LGD \times N[(1 - R)^{-0.5} \times G(PD) + (R / (1 - R))^{0.5} \times G(0.999)] - PD \times LGD$

Risk-weight (RW) = K x 12.5

Risk-weighted amount = RW x EAD

³⁶ This means that the risk-weight also applies to the unsecured portion of such RMs.

QRRE

110. For retail exposures which fall within the IRB subclass of QRRE (see paragraph 26) that are not in default, the risk-weighted amount is calculated as below:

Correlation (R) = 0.04

Capital charge factor (K)

= $LGD \times N[(1 - R)^{-0.5} \times G(PD) + (R / (1 - R))^{0.5} \times G(0.999)] - PD \times LGD$

Risk-weight (RW) = $K \times 12.5$

Risk-weighted amount = $RW \times EAD$

Small Business Retail Exposures and Other Retail Exposures to Individuals

111. For retail exposures which fall within the IRB subclasses of small business retail exposures³⁷ (see paragraph 27) or other retail exposures to individuals (see paragraph 28) that are not in default, the risk-weighted amount is calculated as below:

Correlation (R)³⁸

= $0.03 \times (1 - \text{EXP}(-35 \times PD)) / (1 - \text{EXP}(-35)) + 0.16 \times [1 - (1 - \text{EXP}(-35 \times PD)) / (1 - \text{EXP}(-35))]$

Capital charge factor (K)

= $LGD \times N[(1 - R)^{-0.5} \times G(PD) + (R / (1 - R))^{0.5} \times G(0.999)] - PD \times LGD$

Risk-weight (RW) = $K \times 12.5$

Risk-weighted amount = $RW \times EAD$

(b) Defaulted exposures

112. An AI should use the same risk-weight function set out in paragraph 109, 110 or 111, as the case may be, to calculate the risk-weighted amount of a retail exposure which is in default (i.e. a default of the obligor in respect of the exposure has occurred by virtue of section 149(1) or (5A) of the Rules), except that the capital charge factor (K) for a defaulted retail exposure should be equal to the greater of:

- (i) zero; or
- (ii) the figure resulting from the subtraction of the AI's best estimate of the EL from

³⁷ Where an AI intends to apply a double default framework to small business retail exposures, such exposures should be re-classified as corporate exposures because they should no longer be managed on a pooled or portfolio basis.

³⁸ Correlation (R) is allowed to vary with PD.

the LGD of the exposure.

(B) Credit Risk Components

Probability of Default (PD) and Loss Given Default (LGD)

113. For each identified pool of retail exposures, an AI using the retail IRB approach should provide an estimate of the PD and LGD associated with the pool. The PD for a retail exposure is the greater of the PD associated with the pool to which the retail exposure is assigned or 0.03%. The PD of a retail exposure assigned to a default pool is 100%.
114. Owing to the potential for a very long run cycle in property prices which even comparatively long runs of data may not adequately capture, the estimate of LGD of a retail exposure which falls within the IRB subclass of RM to individuals or RM to property-holding shell companies cannot be set below 10%³⁹.

Exposure at Default (EAD)

115. The EAD of an exposure is measured without deduction of specific provisions and partial write-offs.
116. In relation to an on-balance sheet exposure, an AI should use the current drawn amount of the exposure (for an exposure that is measured at fair value, the current drawn amount is the value determined in accordance with section 4A of the Rules), after taking into account the credit risk mitigating effect of any recognized netting (see Part XIII of this section), as an estimate of the EAD of the exposure such that the EAD of the exposure is not less than the sum of:
- (i) the amount by which an AI's CET1 capital would be reduced if the exposure were fully written-off; and
 - (ii) any specific provisions and partial write-offs in respect of the exposure.

Where the amount by which an AI's estimate of EAD in respect of an exposure exceeds the sum of items (i) and (ii) of the exposure, this amount is termed a discount. The calculation of the risk-weighted amount should be independent of any discounts. In calculating the eligible provisions for the purpose of the EL-eligible provisions calculation as set out in Section C, any discounts attributed to defaulted exposures should be included.

117. In relation to the calculation of EAD of off-balance sheet exposures, an AI should refer to Part XII of this section.

³⁹ The 10% LGD floor should not apply, however, to sub-segments that are subject to, or benefit from, recognized guarantees issued by sovereigns. Furthermore, the existence of the floor does not imply any waiver of the requirements of LGD estimation.

VI. Equity Exposures

(A) Derivation of Risk-weighted Amount

118. An AI is allowed to use either the market-based approach or the PD/LGD approach to calculate the risk-weighted amount of its equity exposures held in the banking book, subject to fulfilling the relevant requirements set out in the Rules including paragraphs 119 and 120 below. In addition, the AI should demonstrate to the satisfaction of the MA that the approach employed:
- (i) is appropriate for the AI's portfolios of equity exposures;
 - (ii) is applied consistently to those portfolios; and
 - (iii) is not used for the purpose of *regulatory capital arbitrage*.
119. Subject to section 43(1)(n) of the Rules, where the net book value of an AI's holdings referred to in subparagraph (i) or (ii) below exceeds 15% of the capital base of the AI as reported in its Form MA(BS)3 as at the immediately preceding calendar quarter end date, the AI must allocate a risk-weight of 1250% to the EAD of that amount of the net book value of the holdings that exceeds that 15% in the calculation of the risk-weighted amount of that portion of the equity exposure –
- (i) the AI's holdings of shares in any *commercial entity* if the holdings amount to more than 10% of the ordinary shares issued by that commercial entity; and
 - (ii) the AI's holdings of shares in any commercial entity if that entity is an *affiliate* of the AI.
120. An AI must calculate the risk-weighted amount of an equity exposure to a financial sector entity that is a *significant capital investment* by multiplying that portion of the EAD of the equity exposure that is not subject to deduction from the AI's CET1 capital under section 43(1)(p) of the Rules by a risk-weight of 250%.

(a) Market-based approach

121. Under this approach, an AI is permitted to calculate the risk-weighted amount of its equity exposures held in the banking book using one or both of the following two separate and distinct methods:
- (i) Simple risk-weight method

A 300% risk-weight is to be applied to equity exposure in a publicly traded company (being an equity security traded on a *recognized exchange*) and a 400% risk-weight is to be applied to all other equity exposures.

Short positions in an equity exposure (including derivative instruments) held in

the banking book are permitted to offset long positions in the same equity exposure, provided that these short positions have been explicitly designated as a hedge of the long positions in that equity exposure and that they have a remaining maturity of at least one year. Other short positions (including the net short position remains after the set-off) are to be treated as if they were long positions with the relevant risk-weight applied to the absolute value of each position. In the context of maturity mismatched positions, the treatment is set out in paragraphs 230 to 232.

(ii) Internal models method

An AI may use its *internal models* to calculate the risk-weighted amount of its equity exposures, subject to fulfilling the relevant requirements set out in the Rules. Under this method, the AI should calculate the risk-weighted amount of its equity exposures by multiplying the potential loss of its equity exposures as derived by using its internal models (e.g. VaR models) subject to the one-tailed 99% *confidence interval* of the difference between quarterly returns of the exposures and an appropriate risk-free rate computed over a long-term observation period (i.e. not less than three years) by 12.5.

The risk-weighted amount calculated under the internal models method should be no less than the risk-weighted amount calculated under the simple risk-weight method using a 200% risk-weight for equity exposure in a publicly traded company and a 300% risk-weight for all other equity exposures. Such minimum risk-weighted amount should be calculated separately using the simple risk-weight method at individual exposure level rather than at portfolio level.

122. An AI may use more than one market-based approach for its different equity portfolios⁴⁰, provided that the AI can demonstrate to the satisfaction of the MA that:

- (i) this is justified having regard to the respective risk profiles of the portfolios; and
- (ii) the AI uses different risk assessment methods for the portfolios in its internal risk management functions.

(b) PD/LGD approach

123. The minimum requirements and methodology for calculating the risk-weighted amount of equity exposures under the PD/LGD approach are the same as those for the foundation IRB approach for corporate exposures, except that:

- (i) the EAD in respect of an equity exposure should be determined in accordance with paragraphs 131 to 133;
- (ii) if the AI has an equity exposure to a corporate but does not have a debt

⁴⁰ For example, the AI may apply the simple risk-weight method to its non-listed equity exposures while the internal models method to its listed equity exposures.

exposure to that corporate such that the AI does not have sufficient information on the corporate for the application of the prescribed default criteria⁴¹ as set out in the Rules, the AI should calculate the risk-weighted amount of the equity exposure such that:

- if the EAD of the AI's equity exposures to the corporate is not more than 15% of the AI's total equity exposures, the AI calculates the risk-weighted amount of the equity exposure by multiplying the EAD of the exposure by the product of the risk-weight as derived from using the risk-weight function set out in paragraph 60 (where applicable, adjusted in accordance with paragraph 66 in respect of exposures to SME corporates or in accordance with paragraph 67 in respect of exposures to financial institutions that are subject to the asset value correlation multiplier) and a factor of 1.5;
 - if the EAD of the AI's equity exposures to the corporate exceeds 15% of the AI's total equity exposures, the AI applies the simple risk-weight method set out in paragraph 121(i);
- (iii) an LGD of 90%⁴² is assumed for deriving the risk-weight of an equity exposure; and
- (iv) M is assumed to be five years.
124. When estimating the PD for an obligor that is highly leveraged or whose assets are predominantly traded assets, ensure such estimate reflects the performance of the obligor's assets based on volatilities calibrated to data from periods of significant financial stress (also see paragraph 83).
125. Hedging for equity exposures under the PD/LGD approach is subject to an LGD of 90% in respect of the exposure to the seller of the hedge. For this purpose, equity exposures will be treated as having a five-year maturity.
126. Under the PD/LGD approach, when the sum of UL and EL in respect of an equity exposure results in lesser capital than would be required from application of one of the minimum risk-weights set out in paragraphs 127 and 128, the minimum risk-weights should be used. In other words, the minimum risk-weight should be applied, if the risk-weight calculated according to paragraph 123 plus the EL in respect of an equity exposure (i.e. EL for non-defaulted exposures = PD x LGD while EL for defaulted exposures = an AI's best estimate of EL) multiplied by 12.5 is less than the minimum risk-weight applicable to the exposure.
127. A minimum risk-weight of 100% applies to the following types of equity exposures as long as the portfolio is managed in the manner outlined below:

⁴¹ In practice, if there are both an equity exposure and a debt exposure to the same counterparty, a default on the debt exposure would thus trigger a simultaneous default for regulatory purposes on the equity exposure.

⁴² There is no advanced approach for equity exposures.

- (i) publicly traded equity exposures held for long-term investment – equity exposures in publicly traded companies where the investment is part of a long-term customer relationship, any capital gains are not expected to be realized in the short-term in accordance with the AI’s investment policy and there is no anticipation of above trend capital gains in the long-term. It is expected that in almost all cases, the AI will have lending and/or general banking relationships with the portfolio company so that the estimated PD is readily available. Given their long-term nature, specification of an appropriate holding period for such investments merits careful consideration. In general, the AI is expected to hold the equity over the long-term (at least five years); and
 - (ii) privately owned equity exposures held for long-term investment – equity exposures in privately owned companies where the returns on the exposures are based on regular and periodic cash flows not derived from capital gains and there is no expectation of future above trend capital gain, or realization of any existing gain in the short-term, in accordance with the AI’s investment policy.
128. For all other equity positions, including net short positions (see paragraph 121(i)), the minimum risk-weights are 200% for publicly traded equity exposures and 300% for all other equity exposures.
129. A risk-weight of 1250% must be applied if the risk-weight calculated in accordance with paragraph 123 plus the EL in respect of an equity exposure multiplied by 12.5 exceeds 1250%.
130. An AI must allocate a risk-weight of 1250% to the EL amount of the equity exposures subject to the PD/LGD approach as determined in accordance with section 223 of the Rules, and add the product of the 2 items to the risk-weighted amount of the AI’s equity exposures.

(B) Credit Risk Components

Exposure at Default (EAD)

131. In general, the measure of EAD for an equity exposure, on which the calculation of the risk-weighted amount is based, is:
- (i) if the equity exposure is measured at fair value, the value determined in accordance with section 4A of the Rules; and
 - (ii) if the equity exposure is not measured at fair value, the cost presented on the balance sheet.
132. Holdings in a collective investment scheme which contains investments which would constitute both equity exposures and non-equity exposures can be treated, in a consistent manner, either as a single investment based on the majority of the scheme’s investments, or, where possible, as separate and distinct investments in the scheme’s component investments based on a look-through approach.

133. Where only the investment mandate of the collective investment scheme is known, the scheme can still be treated as a single investment. For this purpose, it is assumed that the scheme first invests, to the maximum extent allowed under its mandate, in investments which would constitute exposures falling within the IRB class attracting the highest **capital charge** of all the investments permissible under the scheme's investment mandate, and then continues making investments which would constitute exposures falling within other IRB classes in descending order of the level of the capital charge required in respect of such exposures.

VII. Other Exposures

(A) Cash Items

134. The risk-weighted amount of cash items is calculated by multiplying the EAD (i.e., the principal amount) of each item by an applicable risk-weight as specified below:

	Cash items	Risk-weight
1.	Notes and coins <i>This item includes all notes and coins that are the lawful currency of a jurisdiction.</i>	0%
2.	Government certificates of indebtedness <i>This item represents the certificates of indebtedness issued by the HKSAR Government for the issue of legal tender notes.</i>	0%
3.	Gold bullion held in own vault or on an allocated basis, to the extent backed by gold liabilities <i>This item includes all gold bullion held by the AI or held by another person for the AI on an allocated basis, to the extent backed by gold bullion liabilities. Gold bullion held by the AI for other persons should not be reported. Gold bullion held by another person for the AI on an <u>unallocated</u> basis, although backed by the AI's gold bullion liabilities, should be treated as an exposure to a counterparty and risk-weighted according to the IRB class/subclass to which that counterparty belongs.</i>	0%
4.	Gold bullion held not backed by gold liabilities <i>This item includes all gold bullion held by the AI or held by another person for the AI, to the extent not backed by the AI's gold bullion liabilities.</i>	100%
5.	Cash items in the course of collection <i>(a) This item includes all cheques, drafts and other items drawn on other banks that are payable to the account of the AI immediately upon presentation and that are in the process of collection. Included are cheques and drafts</i>	20%

	Cash items	Risk-weight
	<p><i>against which the AI has purchased or discounted the cheques presented by its customer and in respect of which the AI is now seeking payment from the drawee bank.</i></p> <p>(b) <i>Unsettled clearing items that are being processed through any interbank clearing system in Hong Kong and receivables from transactions in securities (other than repo-style transactions), foreign exchange, and commodities which are not yet due for settlement should, however, be subject to a risk-weight of 0%.</i></p> <p><i>Import and export trade bills held by the AI that are in the process of collection should not be included in cash items but should be risk-weighted according to the IRB class/subclass to which the counterparty belongs.</i></p>	0%
6.	<p>Positive current exposures from delivery-versus-payment transactions which remain unsettled after the settlement date</p> <p>(a) for up to 4 business days</p> <p>(b) for 5 to 15 business days</p> <p>(c) for 16 to 30 business days</p> <p>(d) for 31 to 45 business days</p> <p>(e) for 46 or more business days</p> <p><i>This item refers to any positive current exposure arising from transactions in securities (other than repo-style transactions), foreign exchange and commodities entered into on a delivery-versus-payment (DvP) basis where payment/delivery has not yet taken place after the settlement date.</i></p>	<p>0%</p> <p>100%</p> <p>625%</p> <p>937.5%</p> <p>1250%</p>
7.	<p>Amount due from transactions entered into on a basis other than a DvP basis (non-DvP transactions) and which remain unsettled for up to 4 business days after the settlement date (for non-significant amount only)</p> <p><i>This item refers to any non-DvP transaction where an AI has made payment/delivery to a counterparty but payment/delivery from the counterparty has not yet taken place up to and including the fourth business day after the settlement date. Such transactions should be treated as a loan provided by the AI to the counterparty and risk-weighted according to the IRB class/subclass to which that counterparty belongs. The EAD of such transactions should be the amount of the payment made or the current market value of the thing delivered by the AI, plus any positive current exposure associated with the transactions. However, if the EAD of a transaction is immaterial (i.e. less than <u>HK\$10 million</u>), the AI may choose to report such exposures</i></p>	100%

	Cash items	Risk-weight
	<i>under this item and apply a uniform 100% risk-weight to them in order to avoid performing a full credit assessment.</i>	
8.	<p>Amount due from transactions entered into on a basis other than a DvP basis and which remain unsettled for 5 or more business days after the settlement date</p> <p><i>This item refers to any non-DvP transactions in securities (other than repo-style transactions), or transactions in foreign exchange and commodities, that have remained unsettled after the contractual date of payment or delivery to the AI for 5 or more business days. The EAD of such transactions should be the amounts of payment made or the current market value of the thing delivered by the AI, plus any positive current exposure associated with the transactions.</i></p>	1250%

(B) Other Items

135. The risk-weighted amount of other items is calculated by multiplying the EAD (i.e. the principal amount) of each item by a uniform risk-weight of 100%, or a higher risk-weight specified by the MA if the MA is of the view that a particular exposure item poses a higher risk to the AI.

	Other items	Risk-weight
1.	<p>Premises, plant and equipment, other fixed assets for own use, and other interest in land and buildings</p> <p><i>This item includes investments in premises, plant and equipment and all other fixed assets of the AI which are held for own use and also any fixed asset which is held by the AI as lessee under a finance lease in accordance with the Hong Kong Accounting Standard 17 “Leases” issued by the Hong Kong Institute of Certified Public Accountants. Other interest in land which are not occupied or used in the operation of the AI’s business should also be reported here.</i></p>	100% unless otherwise specified by the MA
2.	<p>Exposures subject to the IRB approach which are not elsewhere specified</p> <p><i>This item includes exposures that are not classified under the IRB class of corporate, sovereign, bank, retail or equity exposures or the IRB subclass of cash items.</i></p>	100% unless otherwise specified by the MA

VIII. Purchased Receivables

(A) Derivation of Risk-weighted Amount for Default Risk

136. Purchased receivables should be classified as retail or corporate exposures, according to the nature of the receivables. For receivables belonging unambiguously to one IRB subclass, the risk-weight for default risk is based on the risk-weight function applicable to that particular IRB subclass, as long as the AI can meet the relevant requirements for the use of that particular risk-weight function. For example, if an AI cannot comply with the criteria for QRRE (see paragraph 26), the AI should use the risk-weight function for other retail exposures to individuals (see paragraph 28). Where an AI purchases a hybrid pool of receivables containing a mixture of exposures, the AI should, if it cannot separate the receivables into different IRB subclasses, apply the risk-weight function that will result in the highest risk-weighted amount of the exposures in the pool of purchased receivables.

(a) Purchased retail receivables

137. An AI may use the “top-down” approach to its purchased retail receivables as for other retail exposures (i.e. estimation of credit risk components on a pooled basis), provided that it meets the relevant requirements for retail exposures as set out in the Rules, and, in the case of calculation of default risk, it meets the requirements referred to in section 200(d) of the Rules. The AI may utilize external and internal reference data to estimate the PD and LGD in respect of its purchased retail receivables at the pool level (i.e. the AI is not required to estimate PDs and LGDs or EL for individual retail receivables within the pool). The estimates for PD and LGD (or EL) should be calculated for the purchased retail receivables on a stand-alone basis, that is, without regard to any recourse to, or guarantees from, the seller or other parties.

(b) Purchased corporate receivables

138. An AI which purchases corporate receivables should use the “bottom-up” approach to estimate the credit risk components for individual receivables for the calculation of the risk-weighted amount (i.e. consistent with the treatment of the AI’s corporate exposures). In other words, the AI is not allowed to use the “top-down” approach to its purchased corporate receivables. The estimates for PD and LGD (or EL) should be calculated for each of the purchased corporate receivables on a stand-alone basis, that is, without regard to any recourse to, or guarantees from, the seller or other parties.

(B) Derivation of Risk-weighted Amount for Dilution Risk

139. Dilution refers to the possibility that the amount of a receivable is reduced through cash or non-cash credits to the receivable’s obligor⁴³. The following treatment of

⁴³ Examples include offsets or allowances arising from returns of goods sold, disputes regarding product quality, possible debts of the borrower to a receivable’s obligor, and any payment or promotional discounts offered by the borrower (e.g. a credit for cash payments within 30 days).

dilution risk will be applied regardless of whether the purchased receivables are corporate or retail exposures.

140. Unless an AI can demonstrate to the satisfaction of the MA that the dilution risk it faces is immaterial, the AI should calculate the risk-weighted amount for dilution risk in respect of both purchased corporate and retail receivables as follows:
- (i) at the level of either the pool as a whole (the “top-down” approach) or the individual receivables making up the pool (the “bottom-up” approach), the purchasing AI has to estimate the one-year EL for dilution risk (expressed as a percentage of the EAD of the purchased receivables); and
 - (ii) as with the treatment for default risk, the estimate of dilution risk should be computed on a stand-alone basis, that is, without regard to any recourse to, or guarantees from, the seller or other parties.
141. For the purpose of calculating the risk-weighted amount for dilution risk, the risk-weight function for corporate exposures set out in paragraph 60 (and where applicable, adjusted in accordance with paragraph 66 in respect of SME corporates; paragraph 67 in respect of exposures to financial institutions that are subject to the asset value correlation multiplier; or paragraph 73(i) in respect of HVCRE exposures) should be used as follows:
- (i) PD should be set equal to the AI’s estimate of EL for dilution risk;
 - (ii) LGD should be set at 100%; and
 - (iii) M is determined in accordance with:
 - in the case of purchased corporate receivables, paragraph 103 if the AI uses the foundation IRB approach, or paragraphs 104 to 106 if the AI uses the advanced IRB approach;
 - in the case of purchased retail receivables, paragraphs 104 to 106.

If an AI can demonstrate to the satisfaction of the MA that the AI’s dilution risk in respect of its purchased receivables is monitored and managed by the AI with a view to the risk being resolved within one year after the purchase, the AI may set M at one year.

IX. Leasing Transactions

(A) Leases without Residual Value Risk

142. Exposures arising from leasing arrangements, other than those exposing the AI to residual value risk (see paragraph 143), should be treated as exposures secured by the

leased assets. An AI may recognize the credit risk mitigating effect of the leased assets as recognized collateral if the relevant requirements set out in the Rules are met.

(B) Leases with Residual Value Risk

143. Exposures arising from leasing arrangements that expose the AI to residual value risk should be treated as follows:

- (i) risk-weighted amount for default risk – an AI should calculate the risk-weighted amount for default risk in respect of the exposure by multiplying the discounted lease payment stream (i.e. EAD) by a risk-weight derived by using the risk-weight function applicable to the IRB subclass within which an exposure to the lessee falls (the PD and LGD as those which the AI assigns to the exposure); and
- (ii) risk-weighted amount for residual value risk – an AI should calculate the risk-weighted amount for residual value risk in respect of the exposure by multiplying the residual value of the leased asset by a risk-weight of 100%.

X. Securities Financing Transactions

144. Subject to paragraphs 145, 146 and 147, the credit exposures to assets underlying securities financing transactions (SFTs) booked in the banking book or trading book of AIs should be risk-weighted using the “economic substance” approach as described below, and reported in Divisions B, C and F (if the securities are non-securitization exposures) or Form MA(BS)3(III d) (if the securities are securitization exposures) as appropriate:

- (a) repos of securities - where an AI has sold securities under repo agreements, the securities sold should continue to be treated as assets on the balance sheet of the AI, with **regulatory capital** provided for the credit exposure to the securities (see also sections 75(2), 76(a) and 202(4) and (5) of the Rules);
- (b) reverse repos of securities - where an AI has acquired securities under reverse repo agreements, no regulatory capital is required for the money paid by the AI;
- (c) securities lending - the treatment is similar to that of repo transactions. The securities lent should continue to remain as assets on the balance sheet of the AI, with regulatory capital provided for the credit exposure to the securities (see also sections 75(2), 76(a) and 202(4) and (5) of the Rules); and
- (d) securities borrowing - where the collateral provided is not cash but securities, those securities should continue to remain as assets on the balance sheet of the AI, with regulatory capital provided for the credit exposure to those securities (see also sections 75(4)(b), 76(b) and 202(4) and (5) of the Rules).

145. If the securities underlying the SFTs are **securitization issues**, the AI should determine the risk-weight attributable to the securities in accordance with Part 7 of the

Rules (see also section 75(5) of the Rules) and report the securities in Form MA(BS)3(IIIId) accordingly.

146. Where an AI applies section 75 of the Rules to an SFT booked in its banking book, the AI must determine the risk-weight to be allocated to its exposure under the SFT in accordance with—

- (a) the risk-weight function for corporate, sovereign and bank exposures;
- (b) the risk-weight function for retail exposures; or
- (c) the market-based approach or the PD/LGD approach for equity exposures,

as the case may be, according to the nature of the asset underlying the SFT, and, where applicable, the IRB class within which the issuer of the asset falls.

147. An AI must calculate the risk-weighted amount of an exposure in respect of the asset underlying an SFT booked in its trading book which constitutes a repo of securities, securities lending or securities borrowing with securities provided by the AI as collateral, and determine, by reference to Part 8 of the Rules, the risk-weight to be allocated to the exposure under the SFT.

148. Subject to paragraph 149, the default risk exposures in respect of SFTs (including centrally cleared trades that are treated as bilateral trades) booked in the banking book or trading book of AIs and the associated risk-weighted amount are determined in the following manner:

- (a) AIs with the MA's approval to use the IMM(CCR) approach to calculate the default risk exposures in respect of SFTs (and also any LST arising from those transactions where covered by the IMM(CCR) approval) should report the exposures in Form IRB_OBSD_IMM. The instructions set out in paragraphs 182 to 185 on the use of the IMM(CCR) approach in respect of derivative contracts apply to SFTs (see also sections 202(2) and 76A(2) of the Rules);

- (b) AIs that do not have an IMM(CCR) approval to calculate the default risk exposures in respect of SFTs should calculate the exposures as follows and report the exposures in Form IRB_OBSD_N_IMM:

- (i) repos of securities - the AI must treat the securities sold as if they were an on-balance sheet exposure to the counterparty concerned secured on the money received by the AI, and, accordingly, calculate the risk-weighted amount of the AI's default risk exposure in respect of the transaction taking into account the credit risk mitigating (CRM) effect of the collateral (see also sections 202(1) and (3) and 76A(4) of the Rules);
 - (ii) reverse repos of securities - the AI must treat the money paid by the AI as if it were a loan to the counterparty concerned secured on the securities received by the AI, and, accordingly, calculate the risk-weighted amount of the AI's default risk exposure in respect of the transaction taking into account

the CRM effect of the collateral (see also sections 202(1) and (3) and 76A(5) of the Rules);

- (iii) *securities lending* – the AI must treat the securities lent as if they were an on-balance sheet exposure to the counterparty concerned⁴⁴ secured on the money or securities received by the AI, and, accordingly, calculate the risk-weighted amount of the AI's default risk exposure in respect of the transaction taking into account the CRM effect of the collateral (see also sections 202(1) and (3) and 76A(4) of the Rules);
- (iv) *securities borrowing* – the AI must treat the money paid or the securities provided by the AI as collateral as if it were an on-balance sheet exposure to the counterparty concerned secured on the securities borrowed, and, accordingly, calculate the risk-weighted amount of the AI's default risk exposure in respect of the transaction taking into account the CRM effect of the collateral (see also sections 202(1) and (3) and 76A(7) of the Rules); and
- (v) *margin lending* – the AI must calculate the risk-weighted amount of the default risk exposure in respect of the transaction taking into account the CRM effect of the securities financed by the transaction (see also sections 202(1) and (3) and 76A(6) of the Rules).

149. Subject to paragraph 150, where an AI applies section 76A(2) or 76A(4), (5), (6) and (7), as the case requires, to an SFT, the AI must determine the risk-weight to be allocated to its exposure under the SFT in accordance with—

- (a) the risk-weight function for corporate, sovereign and bank exposures; or
- (b) the risk-weight function for retail exposures,

as the case may be, according to the IRB class within which an exposure to the counterparty to the SFT falls and, where applicable, in accordance with the treatment of credit risk mitigation set out in Division 10 of Part 6 of the Rules.

150. For LSTs arising from SFTs, an AI may determine the relevant risk-weight using the STC approach on a permanent basis.

151. The SFT risk-weighted amount of an AI referred to in paragraph 42(iii) is the sum of the default risk risk-weighted amounts for all counterparties to the SFTs of the AI where the default risk risk-weighted amount for each of the counterparties is calculated as the product of (i) the sum of default risk exposures across all the SFTs with the counterparty mentioned in paragraph 148(b) or calculated in accordance with paragraphs 200 to 205, as the case requires, and (ii) the applicable risk-weight under Part 6 of the Rules (see paragraph 149).

⁴⁴ For securities lending or borrowing where the contractual agreement is made between the securities borrower/lender and the custodian (e.g. Clearstream Banking or Euroclear Bank), and the securities borrower/lender has no knowledge of from/to whom the security is borrowed/lent, the custodian becomes the “counterparty” of the securities borrower/lender.

XI. Credit-linked Notes

152. Where an AI issues a credit-linked note to cover the credit risk of an ***underlying exposure*** (i.e. the AI buys credit protection), the maximum amount of protection is the amount of the funds received from issuing that note. The protected amount should be treated as an exposure collateralized by cash deposits while the remaining unprotected amount, if any, should be treated as an exposure to the issuer of the underlying asset.
153. When an AI buys a credit-linked note (i.e. the AI sells credit protection), it acquires credit exposure on two fronts, to the reference obligation(s) of the note and also to the note issuer. A credit-linked note held by the AI, which is an on-balance sheet exposure, should be allocated a risk-weight, as determined by the applicable risk-weight function, which is the higher of the risk-weight attributable to the reference obligation(s) of the note as if the AI had a direct exposure to the reference obligation(s), or the risk-weight attributable to the note. However, an AI is not required to provide regulatory capital for its exposure to a credit-linked note held by it in excess of the institution's maximum liability under the note.

XII. Calculation of Risk-weighted Amount of Off-balance Sheet Exposures

(A) Classification of Off-balance Sheet Exposures

154. An AI is required to categorize its off-balance sheet exposures into one of the following two types:
- (i) off-balance sheet exposures (other than OTC derivative transactions, credit derivative contracts and SFTs) in the banking book;
 - (ii) OTC derivative transactions, credit derivative contracts and SFTs in both the banking book and trading book.

(B) Derivation of Risk-weighted Amount of Off-balance Sheet Exposures

155. Except as specified in paragraphs 157, 158 and 159, for the calculation of the risk-weighted amount of off-balance sheet exposures, an AI should:
- (i) convert an off-balance sheet exposure into credit equivalent amount (i.e. EAD) by:
 - applying an applicable ***credit conversion factor (CCF)*** to the principal amount of the off-balance sheet exposure (other than OTC derivative transactions, credit derivative contracts and SFTs) in the banking book; and
 - using the IMM(CCR) approach, the current exposure method or the methods referred to in section 10A(1)(b) of the Rules, as permitted under the Rules, in respect of the OTC derivative transaction, credit derivative contract and SFT, as the case may be (the resultant EAD estimate is termed "default risk exposure"); and

- (ii) multiply the credit equivalent amount of the off-balance sheet exposure by an applicable risk-weight.
156. This Part focuses on instructions for the calculation of risk-weighted amount of the default risk exposure of OTC derivative transactions and credit derivative contracts using the IMM(CCR) approach or the current exposure method but include SFTs where specified. For specific instructions for the calculation of risk-weighted amount of the default risk exposures in respect of SFTs, an AI should refer to paragraph 148(a) for those that are subject to the IMM(CCR) approach, and paragraph 148(b) for those that are not.
157. If an exposure arising from an OTC derivative transaction, credit derivative contract or SFT falls within section 226Z of the Rules, an AI that calculates the default risk exposures using methods other than the IMM(CCR) approach may multiply the default risk exposure so calculated by the applicable scaling factor specified in section 226Z(4) of the Rules.
158. For exchange-traded derivative contracts that are treated as bilateral trades for risk-weighting purpose, the default risk exposure of the contracts should be determined as if they were OTC derivative transactions or credit derivative contracts, as the case requires.
159. For LSTs arising from OTC derivative transactions, credit derivative contracts or SFTs, an AI may determine the relevant risk-weight using the STC approach on a permanent basis.
160. Under the current exposure method and the IMM(CCR) approach, the default risk exposures of credit derivative contracts falling within the following categories can be regarded as zero:
- (i) Credit default swaps that have been reported as “direct credit substitutes” in item 1 of Division D (i.e. the AI has already held capital against the credit risk of the reference obligations underlying the swaps);
 - (ii) Recognized credit derivative contracts held by the AI as protection buyer in respect of which the CRM effects have already been taken into account in accordance with Division 10 of Part 6 of the Rules for the purposes of risk-weighted amount calculation.

Off-balance Sheet Exposures (Other than OTC Derivative Transactions, Credit Derivative Contracts and SFTs)

(a) CCFs and EAD

161. An AI should classify each of its off-balance sheet exposures (other than OTC derivative transactions, credit derivative contracts and SFTs) in the banking book as one of the following items:

	Off-balance sheet exposures (other than OTC derivative transactions, credit derivative contracts and SFTs) in the banking book	CCF		
		Corporate/Sovereign/Bank exposures		Retail exposures
		FIRB approach	AIRB approach	Retail IRB approach
1.	<i>Direct credit substitutes</i>	100%	100%	Own estimate
2.	<i>Transaction-related contingencies</i>	50%	Own estimate	Own estimate
3.	<i>Trade-related contingencies</i>	20%	Own estimate	Own estimate
4.	<i>Asset sales with recourse</i>	100%	100%	Own estimate
5.	<i>Forward asset purchases</i>	100%	100%	Own estimate
6.	<p><i>Partly paid-up securities</i> (being an off-balance sheet exposure to the credit risk of the securities purchased from an issuer where only a part of the issue price or nominal face value of the securities has been paid by the institution and the institution will be required to pay the unpaid amount in the future)</p> <p><i>In respect of partly paid-up equity shares, the unpaid portion of which an AI may be called upon by the issuer to pay should be subject to a CCF of 100% and reported under equity exposures, together with the paid-up portion.</i></p>	100%	100%	Own estimate
7.	<i>Forward forward deposits placed⁴⁵</i>	100%	100%	Own estimate
8.	<i>Note issuance and revolving underwriting facilities</i>	75%	Own estimate	Own estimate
9.	<i>Commitments that are unconditionally cancellable</i>	0%	Own	Own

⁴⁵ Where an AI has contracted to receive a deposit (i.e. forward deposits taken), failure to deliver by the counterparty may result in an unanticipated change in the AI's interest rate exposures and involve a replacement cost. Such exposure should thus be accorded the same treatment as interest rate contracts (see paragraph 168).

	Off-balance sheet exposures (other than OTC derivative transactions, credit derivative contracts and SFTs) in the banking book	CCF		
		Corporate/Sovereign/Bank exposures		Retail exposures
		FIRB approach	AIRB approach	Retail IRB approach
	<i>without prior notice</i> (i.e. off-balance sheet exposures that do not fall within any of items 1 to 8 and arise from commitments which may be cancelled at any time unconditionally by an AI or which provide for automatic cancellation due to a deterioration in the creditworthiness of the person to whom the commitment has been made ⁴⁶);		estimate	estimate
10.	Other commitments			
	(a) Subject to paragraph (b), commitments which do not fall within item 9; and (b) the drawdown of which will give rise to an off-balance sheet exposure falling within any of items 1 to 8 or item 11.	75% The lower of 75% or the CCF applicable to the off-balance sheet exposure arising from the drawdown of the commitment concerned	Own estimate Own estimate	Own estimate Own estimate
11.	Others <i>This item includes any off-balance sheet exposure not classified as the above items.</i>	A CCF specified by the MA or 100%		

162. An AI using the advanced IRB approach for corporate, sovereign and bank exposures or the retail IRB approach for retail exposures is allowed to provide its own estimates of CCFs for off-balance sheet exposures as listed in paragraph 161.

⁴⁶ Included in this item are those facilities that are unconditionally cancellable without prior notice by the AI other than for “force majeure” reasons, or that effectively provide for automatic cancellation due to deterioration in a borrower’s creditworthiness. This also includes any revolving or undated/open-ended commitments, e.g. overdrafts or unused credit card lines, provided that these commitments can be unconditionally cancelled at any time and subject to credit review at least annually.

163. For corporate, sovereign and bank exposures, the principal amount to which the CCF is applied is the lower of (i) the amount of the unused committed credit line or (ii) the amount that reflects any possible constraining availability of the facility (e.g. the existence of a ceiling on the potential lending amount subject to the borrower's reported cash flow). If the facility is constrained in this manner, the AI should have sufficient monitoring and management procedures to support this treatment.
164. For retail exposures with an uncertain future drawdown (e.g. credit cards), an AI should take into account the drawdown and repayment history and expectation of additional drawings by the obligors prior to default in its overall calibration of loss estimates. In particular, where an AI does not reflect CCFs for undrawn lines in its EAD estimates, it should reflect in its LGD estimates the likelihood of additional drawings prior to default. Conversely, if an AI does not incorporate the possibility of additional drawings in its LGD estimates, it should do so in its EAD estimates.
165. When only the drawn balances of retail facilities have been securitized, an AI should ensure that it continues to hold required capital against its share (i.e. seller's interest) of undrawn balances related to the securitization exposures under the IRB approach. For determining the EAD associated with the seller's interest in the undrawn lines, the undrawn balances of securitization exposures will be allocated between the seller's and *investors' interests* on a pro rata basis, based on the proportion of the seller's and investors' shares of the securitized drawn balances.
166. For item 11 under paragraph 161, an AI should apply a CCF of 100%, unless a CCF applicable to the exposure is specified in Part 2 of Schedule 1 to the Rules.

(b) Calculation of risk-weighted amount

167. In calculating the risk-weighted amount of off-balance sheet exposures (other than OTC derivative transactions, credit derivative contracts and SFTs) in the banking book, the applicable risk-weight to an exposure should be derived from the risk-weight function for the IRB class/subclass within which the exposure falls.

OTC Derivative Transactions and Credit Derivative Contracts (including centrally cleared trades that are treated as bilateral trades) under the Current Exposure Method

(a) CCFs for OTC derivative transactions

168. An AI should classify its OTC derivative transactions into one of the following items:

	OTC derivative transactions	CCF		
		Residual maturity: 1 year or less	Residual maturity: Over 1 year to 5 years	Residual maturity: Over 5 years

1.	<i>Exchange rate contracts</i> ⁴⁷	1.0%	5.0%	7.5%
2.	<i>Interest rate contracts</i>	0.0%	0.5%	1.5%
3.	<i>Equity contracts</i>	6.0%	8.0%	10.0%
4.	<i>Precious metal contracts</i>	7.0%	7.0%	8.0%
5.	<i>Debt security contracts</i> or <i>other commodity contracts</i>	10.0%	12.0%	15.0%

169. For contracts with multiple exchanges of principal, the CCFs to be used are to be multiplied by the number of remaining payments in the contract.
170. For contracts structured to settle outstanding exposure on specified payment dates and where the terms are reset such that the market value of the contract is zero on these dates, the residual maturity should be set equal to the time until the next reset date. In the case of interest rate contracts that meet these criteria and the remaining time to final maturity of the contracts is more than one year, the CCF is subject to a floor of 0.5%.

(b) CCFs for credit derivative contracts in the trading book

171. An AI should classify its credit derivative contracts that are booked in the trading book into one of the following items according to the role of the AI in the contract (i.e. protection buyer or protection seller) and the credit quality of the reference obligation:

	Credit derivative contracts in the trading book	CCF	
		Protection buyer	Protection seller
1.	<u>Total return swap</u>		
a.	Qualifying reference obligation	5%	5%
b.	Non-qualifying reference obligation	10%	10%
2.	<u>Credit default swap</u>		
a.	Qualifying reference obligation	5%	5%*
b.	Non-qualifying reference obligation	10%	10%*

There will be no difference depending on residual maturity.

⁴⁷ Forward exchange rate contracts arising from swap deposit arrangements can be excluded from the calculation of risk-weighted amount. Under such contracts, the money deposited by the customer remains under the control of the AI at all times during the transaction, and the AI will be in a position to ensure that the customer does not default on the settlement of the forward contract.

*The definition of “qualifying” is the same as for the “qualifying” class for the treatment of specific risk under the **STM approach** for market risk as described in the completion instructions of Form MA(BS)3(IV).*

** The protection seller of a credit default swap is only subject to the add-on factor where it is subject to close-out upon the insolvency of the protection buyer while the position in the underlying exposure is still solvent. Add-on amount should be capped at the amount of unpaid premium.*

172. Where the credit derivative contract is a **first-to-default credit derivative contract** linked to a basket of reference obligations, the CCF of non-qualifying reference obligations will be used if there is at least one non-qualifying reference obligation in the basket of reference obligations; otherwise, the CCF of qualifying reference obligations should be applied. For **second-to-default credit derivative contract**, the CCF of non-qualifying reference obligations will be used if there are at least two non-qualifying reference obligations in the basket; otherwise, the CCF of qualifying reference obligations should be applied. The same principle applies to other subsequent-to-default credit derivative contracts.

(c) CCFs for other OTC derivative transactions and credit derivative contracts not specified under subsections (a) and (b)

173. An AI should treat an OTC derivative transaction or a credit derivative contract that is not specified under subsections (a) and (b) above as if it fell within item 5 of paragraph 168 and apply the relevant CCF specified under that item, unless a CCF applicable to the exposure is specified in Part 2 of Schedule 1 to the Rules.

(d) Calculation of EAD

174. As under the STC approach, an AI using the IRB approach should calculate the default risk exposures in respect of its OTC derivative transactions and credit derivative contracts under the current exposure method by determining the credit equivalent amount of each OTC derivative transaction and credit derivative contract, which is the sum of:
- (i) **current exposure**, which is the replacement cost (obtained by “marking to market”) of each derivative contract that has a positive value (where a contract has a negative value, its current exposure should be taken as zero); and
 - (ii) **potential exposure** (i.e. the add-on), which is derived by multiplying the principal amount of the contract by the applicable CCF.
175. For single-currency floating / floating interest rate swap contracts, the current exposures of these swap contracts should be taken as their credit equivalent amounts.
176. For all derivative contracts, the calculation of the potential exposure should be based on the effective notional amount which reflects the actual risk inherent in the contract. For example, where the contract provides for the multiplication of cash flows as in leveraged derivative contracts, the notional amount should be adjusted to take into

account this leveraged effect.

177. The default risk exposure in respect of a derivative contract should be adjusted for the risk mitigating effects of any recognized netting (see paragraphs 197 to 199).
178. If an exposure arising from an OTC derivative transaction or credit derivative contract falls within section 226Z of the Rules, an AI that calculates the default risk exposures using methods other than the IMM(CCR) approach may multiply the default risk exposure so calculated by the applicable scaling factor specified in section 226Z(4) of the Rules.
179. Where an AI enters into no less than one OTC derivative transaction or credit derivative contract with a counterparty, the applicable default risk exposure in respect of the transactions and contracts with that counterparty (the ***outstanding default risk exposure***) is the greater of :
- (i) zero; or
 - (ii) the difference between –
 - (A) the sum of default risk exposures across all netting sets with the counterparty; and
 - (B) the ***CVA loss*** in respect of that counterparty.

(e) Calculation of risk-weighted amount

180. The CEM risk-weighted amount in respect of OTC derivative transactions and credit derivative contracts of an AI is the sum of the default risk risk-weighted amounts for all the counterparties to the contracts where the default risk risk-weighted amount for each of the counterparties is calculated as the product of-
- (i) the outstanding default risk exposure to the counterparty as calculated under paragraph 179; and
 - (ii) the applicable risk-weight to the exposure derived from the risk-weight function for the IRB class/subclass within which the counterparty of the exposure falls.
181. For the calculation of the risk-weighted amount for LSTs arising from OTC derivative transactions and credit derivative contracts, an AI may determine the relevant risk-weight using the STC approach on a permanent basis.

OTC derivative transactions, credit derivative contracts and SFTs (including centrally cleared trades that are treated as bilateral trades) under the IMM(CCR) approach

(a) Calculation of EAD and risk-weighted amount

182. An AI may use the IMM(CCR) approach to calculate the default risk exposures in

respect of bilateral trades (including centrally cleared trades that are treated as bilateral trades) arising from OTC derivative transactions, credit derivative contracts and SFTs (including any LST arising from those transactions or contracts) if it has an IMM(CCR) approval for those transactions, contracts or LSTs, as the case may be.

183. An AI must calculate -

- (i) the portfolio-level risk-weighted amount of the relevant exposures based on current market data in accordance with sections 226D(1)(a) and (2)(a) of the Rules; and
- (ii) the portfolio-level risk-weighted amount of the relevant exposures based on stress calibration in accordance with sections 226D(1)(b), (2)(b) and (3) of the Rules.

184. For the calculation of the risk-weighted amounts referred to in paragraph 183(i) and (ii) in respect of LSTs arising from OTC derivative transactions, credit derivative contracts and SFTs, an AI may determine the relevant risk-weight using the STC approach on a permanent basis.

185. The higher of the portfolio-level risk-weighted amount calculated under paragraph 183(i) and (ii) is the ***IMM(CCR) risk-weighted amount*** in respect of the OTC derivative transactions, credit derivative contracts and SFTs of the AI that are covered by its IMM(CCR) approval. Accordingly, the default risk exposures of the OTC derivative transactions, credit derivative contracts and SFTs to be reported in Form IRB_OBSD_IMM are those calculated in accordance with sections 226E to 226M of the Rules that give rise to the IMM(CCR) risk-weighted amount (i.e. the higher of the number calculated under paragraph 183(i) and (ii)).

XIII. Credit Risk Mitigation

(A) General

186. Subject to paragraphs 188 and 189, under the IRB approach, an AI may take into account the effect of recognized credit risk mitigation in its calculation of risk-weighted amount of exposures, including:

- (i) recognized collateral;
- (ii) recognized netting; and
- (iii) recognized guarantees and recognized credit derivative contracts.

187. The risk-weighted amount of an AI's exposure in respect of which recognized credit risk mitigation has been taken into account shall not be higher than that of an identical exposure in respect of which recognized credit risk mitigation has not been so taken into account.

188. An AI must not take into account the effect of recognized credit risk mitigation in accordance with Division 10 of Part 6 of the Rules in calculating the risk-weighted amount of its exposures to the extent that the credit risk mitigating effect concerned has already been taken into account in the AI's calculation of the risk-weighted amount for its exposures in accordance with the Rules other than that Division.
189. Where an AI has bought credit protection for an exposure and the credit protection is in the form of a single-name credit default swap that falls within section 226J(1) of the Rules, the AI must not take into account the credit risk mitigating effect of that swap when calculating the risk-weighted amount of the exposure.

(B) Capital Treatment of Recognized Collateral

190. Under the IRB approach, collateral is recognized through the determination of LGD (see paragraphs 84 to 97 for corporate, sovereign and bank exposures and paragraphs 113 and 114 for retail exposures).

(C) Capital Treatment of Recognized Netting

(a) General

191. Subject to paragraph 206, where an AI is entitled pursuant to a valid bilateral netting agreement **or valid cross-product netting agreement** to net amounts owed by the AI to a counterparty against amounts owed by the counterparty to the AI, the AI may take into account the credit risk mitigating effect of the recognized netting in calculating the EAD of its exposure to the counterparty.

(b) EAD measurement for on-balance sheet netting

192. In respect of on-balance sheet exposures which fall within the IRB class of corporate, sovereign, bank, retail or other exposures, an AI may net the debit balances from the credit balances in the accounts of the same counterparty in accordance with the formula set out in paragraph 193 and report the net credit exposure amount as on-balance sheet exposures before recognized guarantees/credit derivative contracts.
193. Below is the formula for calculating the net credit exposure with a counterparty for on-balance sheet exposures, adjusted for the credit risk mitigating effect of a valid bilateral netting agreement:

$$\text{Net credit exposure} = \max [0, \text{exposures} - \text{liabilities} \times (1 - H_{fx})]$$

194. H_{fx} is the haircut to be applied in the case of a currency mismatch between exposures and liabilities, which is 8% assuming a **minimum holding period** of 10 business days, daily remargining and daily marking-to-market. It should be adjusted in accordance with the provisions set out in paragraph E3 of Annex IIIb-E of the completion instructions of Form MA(BS)3(IIIb) if a different minimum holding period is adopted,

or the exposure is not remargined or revalued daily as assumed.

195. Treatments for maturity mismatch in respect of on-balance sheet netting are set out in paragraphs 230 to 232.
196. In respect of sovereign exposures, the market makers of Exchange Fund Bills/Notes which have short positions in these instruments may report their net holdings, provided that the short positions are covered by the Sale and Repurchase Agreements with the HKMA. The following steps should be taken in determining the amount to be reported:
- (i) the long and short positions of instruments with a residual maturity of under one year may be offset with each other;
 - (ii) the long and short positions of instruments with a residual maturity of one year and over may be offset with each other;
 - (iii) if the net positions of both items (i) and (ii) above are long, the positions should be reported; and
 - (iv) if the net position in item (i) is long and the net position in item (ii) is short, or the other way round, the positions can be netted with each other on a dollar for dollar basis. The resultant net long position, if any, should be reported.

(c) EAD measurement for netting of OTC derivative transactions and credit derivative contracts under the current exposure method

197. An AI is allowed to net exposures arising from OTC derivative transactions and credit derivative contracts with the same counterparty, provided that such exposures are subject to a valid bilateral netting agreement. The netting agreement may cover only a single type or more than one type of contracts or transactions. The recognition of the credit risk mitigating effect of a **valid cross-product netting agreement** is only available in respect of an AI's transactions with a counterparty that are covered by an IMM(CCR) approval.
198. An AI is required to calculate an aggregate default risk exposure for OTC derivative transactions and credit derivative contracts subject to a valid bilateral netting arrangement and report it as the default risk exposure before recognized guarantees/credit derivative contracts. Under the current exposure method, the aggregate default risk exposure of OTC derivative transactions and credit derivative contracts subject to a valid bilateral netting agreement should be the sum of:
- (i) current exposure, which is the net amount of the sum of the positive and negative mark-to-market values of the individual contracts or transactions covered by a valid bilateral netting agreement, if positive; and
 - (ii) potential exposure (the net add-on or A_{Net}), which is derived by adding 40% of the sum of the products derived by multiplying the principal amount of each of those contracts or transactions by the CCFs and 60% of the Net/Gross Ratio

(NGR) multiplied by the sum of the products derived by multiplying the principal amount of each of those contracts or transactions by the CCFs. This is expressed through the following formula:

$$A_{\text{Net}} = 0.4 \times A_{\text{Gross}} + 0.6 \times \text{NGR} \times A_{\text{Gross}}$$

where:

A_{Gross} = the sum of the individual add-on amounts (derived by multiplying the principal amount by the CCF) of all contracts or transactions covered by the valid bilateral netting agreement with the same counterparty

NGR = the ratio of net replacement cost to gross replacement cost for contracts covered by the valid bilateral netting agreement

199. The NGR in the above formula can be calculated on a counterparty by counterparty or on an aggregate basis for all contracts or transactions covered by a valid bilateral netting agreement. However, the basis chosen by an AI should be used consistently. An illustration of the calculation of NGR based on the two methods is given in Annex IIIb-G of the completion instructions of Form MA(BS)3(IIIb).

(d) EAD measurement for netting of repo-style transactions not under the IMM(CCR) approach

200. Where repo-style transactions are subject to a valid bilateral netting agreement, an AI may choose not to take into account the netting effects in calculating the risk-weighted amount for such transactions. In taking into account the credit risk mitigating effects of recognized netting for repo-style transactions, the AI should calculate the net credit exposure ($E^{\#}$) using the formula below, and equate $E^{\#}$ as the default risk exposure before recognized guarantees/credit derivative contracts.

$$E^{\#} = \text{Max} \{0, [(\sum(E) - \sum(C)) + \sum(E_s \times H_s) + \sum(E_{fx} \times H_{fx})]\}$$

where:

$E^{\#}$ = Net credit exposure

E = Current market value of money and securities sold, transferred, loaned or paid by the AI

C = Current market value of money and securities received by the AI

E_s = Absolute value of the net position in the same securities

H_s = Haircut applicable to the absolute value of the net position in the same securities (i.e. E_s) pursuant to the standard supervisory haircuts for the comprehensive approach to the treatment of recognized collateral subject to adjustment as set out in section 92 of the Rules

E_{fx} = Absolute value of the net position in a currency different from the settlement currency

H_{fx} = Haircut applicable in consequence of a currency mismatch, if any, between the currency in which a net position is denominated and the settlement currency pursuant to the standard supervisory haircuts for currency mismatch set out in Schedule 7 of the Rules subject to adjustment as set out in section 92 of the Rules

201. The AI should compare the aggregate market value of money and securities sold, transferred, loaned or paid with the aggregate market value of money and securities received, taking into account haircuts in the formula specified in paragraph 200. Where the value calculated in accordance with the formula is greater than zero, the AI has a net credit exposure to the counterparty for which capital requirement should be provided.
202. For appropriate values of haircuts to be applied, the AI should refer to Annex IIIb-E of the completion instructions of Form MA(BS)3(IIIb), which set out the standard supervisory haircuts and the circumstances requiring haircut adjustments under the comprehensive approach to treatment of collateral under the STC approach. As under the STC approach, a haircut of 0% may be applied for repo-style transactions where the criteria specified under Annex IIIb-D of the completion instructions of Form MA(BS)3(IIIb) are satisfied.
203. In general, repo-style transactions in the banking book and the trading book should be netted separately. Netting across positions in different books with the same counterparty will only be allowed if:
- (i) all transactions are marked-to-market daily; and
 - (ii) the collateral used in the transactions is recognized collateral for transactions booked in the banking book.
204. Where the AI has been approved for using internal models to measure market risk for capital adequacy purposes, it may, subject to the prior consent of the MA, use a VaR approach as an alternative to the use of standard supervisory haircuts, to reflect the price volatility of the exposure and collateral for repo-style transactions covered by valid bilateral netting agreements on a counterparty-by-counterparty basis. The criteria for using the VaR approach and the related capital treatments are set out in Annex IIIb-F of the completion instructions of Form MA(BS)3(IIIb).
205. For corporate, sovereign and bank exposures under the foundation IRB approach, the impact of collateral on these repo-style transactions may not be reflected through an adjustment to LGD. Under the advanced IRB approach, own LGD estimates would be permitted for the unsecured net exposure amount ($E^{\#}$). The risk-weight of the net exposure amount will be determined using the risk-weight function applicable for that particular IRB class/subclass. For LSTs arising from repo-style transactions, an AI may determine the relevant risk-weight using the STC approach on a permanent basis.

(e) EAD measurement for netting of OTC derivative transactions, credit derivative contacts and SFTs under the IMM(CCR) approach

206. An AI that uses the IMM(CCR) approach to calculate the EAD of a netting set that contains OTC derivative transactions, credit derivative contacts or SFTs should take into account the effect of any recognized netting in respect of the transactions or contracts concerned in the manner set out in Part 6A of the Rules instead of as stated above except for transactions for which the AI is permitted under section 10B(5), or has chosen under section 10B(7), of the Rules to use the methods referred to in section 10A(1)(b) of the Rules.

(D) Capital Treatment of Recognized Guarantees and Recognized Credit Derivative Contracts

207. Under the IRB approach, an AI may use the *substitution framework* to take into account the credit risk mitigating effects of recognized guarantees and recognized credit derivative contracts in calculating the risk-weighted amount of an exposure. Alternatively, an AI may use the double default framework to take into account the credit risk mitigating effect of a recognized guarantee or recognized credit derivative contract for each exposure which meets the requirements for using the double default framework.
208. If a recognized guarantee is provided to an AI or a recognized credit derivative contract is entered into by the AI, and the AI does not use the IRB approach to calculate its credit risk for exposures to the guarantor or counterparty, the AI should not take into account the credit risk mitigating effect of the guarantee or contract, in calculating, under the IRB approach, the risk-weighted amount of the exposure which is covered by the guarantee or contract.
209. Consistent with the STC approach, an AI may choose not to take into account the credit risk mitigating effects of guarantees and credit derivative contracts under the substitution framework or the double default framework, if doing so would result in a higher risk-weighted amount.
210. An AI should have in place clearly documented criteria, methods and processes for taking into account the credit risk mitigating effect of recognized guarantees and recognized credit derivative contracts, and the effects should be taken into account consistently both for a given type of recognized guarantee or recognized credit derivative contract and over time.
211. In respect of credit derivative contracts, only credit default swaps and total return swaps that provide credit protection will be recognized. However, where an AI buys the credit protection through a total return swap and records the net payments received on the swap as net income, but does not record offsetting deterioration in the value of the asset that is protected (either through reductions in fair value or by an addition to reserves or provisions), the credit protection will not be recognized. Credit-linked notes issued by the AI which fulfil the operational requirements for credit derivative contracts will be treated as cash collateralized transactions (see paragraph 152).

Corporate, Sovereign and Bank Exposures

(a) Substitution framework

212. Under the substitution framework, there are two approaches for taking into account the credit risk mitigating effect of recognized guarantees and recognized credit derivative contracts: (i) the foundation IRB approach and (ii) the advanced IRB approach. Under the substitution framework, credit risk mitigation in the form of guarantees and credit derivative contracts should not reflect the effect of ***double default***. As such, to the extent that the credit risk mitigation is recognized by an AI, the adjusted risk-weight will not be less than that of a comparable direct exposure to the credit protection provider except where a case falls within paragraph 214(ii) or 218.

Foundation IRB Approach

213. For an AI using the foundation IRB approach, the treatment of recognized guarantees and recognized credit derivative contracts closely follows that under the comprehensive approach to the treatment of the same under the STC approach.
214. The credit risk mitigating effect of recognized guarantees and credit derivative contracts is taken into account as follows:
- (i) for the covered portion of the exposure, subject to subparagraph (ii), a risk-weight is derived by taking the risk-weight function applicable to the IRB class/subclass to which the credit protection provider belongs, and the PD associated with the internal obligor grade of the credit protection provider or the PD of an obligor grade falling between the internal obligor grades of the underlying obligor and the credit protection provider if the AI considers that a full substitution treatment may not be warranted. Where a portion of the exposure is covered by a recognized guarantee (original guarantee) and is the subject of a counter-guarantee given by a sovereign, the AI may, in respect of the credit protection covered portion, treat the counter-guarantee as if it were the original guarantee if the criteria set out in section 216(3A) or 217(4) of the Rules, as the case may be, are met;
 - (ii) where an exposure of the AI is covered by a recognized credit derivative contract cleared by a ***qualifying CCP***, the AI may allocate to the covered portion of the exposure (a) a risk-weight of 2% if the requirements of section 216(3B)(a) of the Rules are met; or (b) a risk-weight of 4% if the requirements of section 216(3B)(b) of the Rules are met;
 - (iii) the AI may replace the LGD of the underlying exposure with the LGD applicable to the guarantee/credit derivative contract taking into account the seniority and any recognized collateral of the credit protection;
 - (iv) the uncovered portion of the exposure is assigned the risk-weight associated with the underlying obligor; and

- (v) an AI should allocate a risk-weight of 1250% to the *first loss portion* in determining the risk-weighted amount where the credit protection for an AI's exposure consists of a recognized credit derivative contract providing that, on the happening of a credit event, the credit protection provider is not obliged to make a payment for any loss until the loss exceeds a specified amount (i.e. the first loss portion) and the credit protection provider is not obliged to make a payment for any loss except to the extent that the loss exceeds the first loss portion.
215. Where partial coverage exists, or where there is a currency mismatch or maturity mismatch between the underlying obligation and the credit protection, an AI should split the exposure into a covered and an uncovered portion as follows:
- (i) proportional cover – Where the amount guaranteed, or against which credit protection is held, is less than the amount of the exposure, and the secured and unsecured portions are of equal seniority (i.e. the AI and the credit protection provider share losses on a pro-rata basis), capital relief will be afforded on a proportional basis. That means the protected portion of the exposure will receive the treatment applicable to recognized guarantees/credit derivative contracts, with the remainder treated as unsecured.
 - (ii) tranching cover – If the institution has obtained *tranching credit protection* for its exposure, it must decompose the exposure into a protected sub-tranche and an unprotected sub-tranche, and determine the risk-weighted amount of the exposure in accordance with Part 7 of the Rules.
 - (iii) currency mismatch / maturity mismatch – The treatment of currency mismatch is set out in paragraphs 228 and 229 and that of maturity mismatch is set out in paragraphs 230 to 232.

Advanced IRB Approach

216. Subject to paragraph 218, an AI using the advanced IRB approach may reflect the credit risk mitigating effect of recognized guarantees and recognized credit derivative contracts through adjusting either PD or LGD estimates. Whether adjustments are done through PD or LGD, they should be done in a consistent manner for a given type of guarantees or credit derivative contracts. In doing so, the AI should not include the effect of double default in such adjustments. Thus, the adjusted risk-weight should not be less than that of a comparable direct exposure to the credit protection provider.
217. An AI relying on its own estimates of LGD has the option to adopt the treatment for AIs using the foundation IRB approach (see paragraphs 213 to 215), or to make an adjustment to its LGD estimate of the exposure to reflect the presence of the recognized guarantee/credit derivative contract under the advanced IRB approach.
218. Where an exposure of the AI is covered by a recognized credit derivative contract cleared by a qualifying CCP, the AI may allocate to the covered portion of the exposure (a) a risk-weight of 2% if the requirements of section 217(5)(a) of the Rules

are met; or (b) a risk-weight of 4% if the requirements of section 217(5)(b) of the Rules are met.

(b) Double default framework

219. Corporate exposures (excluding specialized lending under supervisory slotting criteria approach) or public sector entity exposures (excluding exposures to sovereign foreign public sector entities) that are hedged by recognized guarantees/credit derivative contracts and satisfy the relevant requirements as set out in the Rules are eligible for the double default framework for recognition of the credit risk mitigating effect.
220. The risk-weighted amount of hedged exposures should be calculated according to the risk-weight function set out in paragraph 62 (and, where applicable, adjusted by paragraph 66(ii) in respect of SME corporates; paragraph 67 in respect of exposures to financial institutions that are subject to the asset value correlation multiplier; or paragraph 73(i) in respect of HVCRE exposures). The risk-weighted amount of the unhedged exposure should be calculated in the same way as for all other corporate exposures to the same obligor of the underlying exposure according to the risk-weight function set out in paragraph 60 (and, where applicable, adjusted by paragraph 66(i) in respect of SME corporates; paragraph 67 in respect of exposures to financial institutions that are subject to the asset value correlation multiplier; or paragraph 73(i) in respect of HVCRE exposures).

Retail Exposures

221. An AI using the retail IRB approach may use the substitution framework as set out in paragraphs 216 to 218 to take account of the credit risk mitigating effects of recognized guarantees and recognized credit derivative contracts in calculating the risk-weighted amount of a retail exposure.

Equity Exposures

222. An AI using the PD/LGD approach may use the substitution approach set out in paragraphs 213 to 215 to take account of the credit risk mitigating effects of recognized guarantees and recognized credit derivative contracts in calculating the risk-weighted amount of an equity exposure.

Purchased Receivables

223. For both purchased corporate and retail receivables, recognized guarantees and recognized credit derivative contracts under the substitution framework will be recognized generally using the substitution framework as set out in paragraphs 213 to 218, without regard to whether the guarantee or contract, as the case may be, covers default risk or dilution risk, or both.
224. If the recognized guarantee/credit derivative contract covers both the purchased receivable's default risk and dilution risk, an AI should substitute the risk-weight of

the exposure to the credit protection provider for the sum of the purchased receivable's risk-weights for default risk and dilution risk which would otherwise be allocated to the exposure in respect of the purchased receivable in accordance with paragraphs 136 to 141.

225. If the recognized guarantee/credit derivative contract covers only default risk or dilution risk, but not both, an AI should substitute the risk-weight of the exposure to the credit protection provider for the risk-weight which would otherwise be allocated in respect of the default risk or dilution risk, as the case may be, covered by the guarantee/contract for the purpose of calculating the risk-weighted amount of the AI's exposure for default risk or dilution risk, as the case may be, in respect of the purchased receivable. The risk-weighted amount of the purchased receivable for the other risk component (being default risk or dilution risk not covered by the guarantee/contract, as the case may be), will then be added.
226. If the recognized guarantee/credit derivative contract covers only a portion of the default risk and/or dilution risk, an AI should divide the exposure into a covered portion and an uncovered portion for the default risk and dilution risk in accordance with paragraph 215 for proportional or tranching coverage. An AI should calculate the risk-weighted amount of the uncovered portion of the exposure in respect of default risk and dilution risk in accordance with paragraphs 136 to 141 and the risk-weighted amount of the covered portion of the exposure in respect of default risk and dilution risk in accordance with paragraph 224.
227. If the recognized guarantee/credit derivative contract covers only the dilution risk in respect of a purchased corporate receivable and the exposure meets the requirements set out in the Rules, an AI may use the double default framework to calculate the risk-weighted amount for dilution risk of the hedged exposure. In this case, paragraph 62 (and, where applicable, adjusted by paragraph 66(ii) in respect of SME corporates; paragraph 67 in respect of exposures to financial institutions that are subject to the asset value correlation multiplier; or paragraph 73(i) in respect of HVCRE exposures) apply with PD_o equal to the estimated EL for dilution risk, LGD_g equal to 100%, and M set according to paragraph 107.

(E) Currency Mismatches

228. Where a foreign currency mismatch occurs, i.e. when the credit protection is denominated in a currency different from that of the underlying obligation, the portion covered by the credit protection should be reduced by a standard haircut of 8%.

$$G_a = G \times (1 - H_{fx})$$

where:

G_a = Credit protection covered portion adjusted for currency mismatch

G = Maximum amount payable to the AI under the credit protection

H_{fx} = Haircut applicable for currency mismatch between the credit protection and underlying obligation pursuant to the standard

supervisory haircuts for the comprehensive approach to the treatment of recognized collateral subject to adjustment as set out in section 92 of the Rules

229. The 8% haircut is based on a 10-business day holding period, daily remargining and daily marking-to-market. This haircut has to be adjusted in accordance with Annex IIIb-E of the completion instructions of Form MA(BS)3(IIIb) when the minimum holding period or the mark-to-market frequency of the transactions is different from that of the standard supervisory haircut.

(F) Maturity Mismatches

230. The maturity of both the underlying exposure and the credit protection (i.e. on-balance sheet netting, recognized collateral, guarantees and credit derivative contracts) should be defined conservatively. The effective maturity of the underlying exposure should be regarded as the longest possible remaining time before the obligor is scheduled to fulfil its obligation, taking into account any applicable grace period. For the credit protection, embedded options which may reduce the term of the credit protection should be taken into account such that the shortest possible effective maturity should be considered. Where a call is at the discretion of the protection provider, the maturity will always be the first call date. If the call is at the discretion of the AI as the protection buyer but the terms of the arrangement of obligation of the hedge contain a positive incentive for the buyer to call the transaction before contractual maturity, the remaining time to the first call date will be deemed to be the effective maturity.
231. A maturity mismatch occurs where the residual maturity of the credit protection is shorter than that of the underlying exposure. The credit protection will be recognized when the hedge has an original maturity of longer than or equal to one year. As a result, the maturity of hedges for exposures with original maturities of less than one year must be matched to be recognized. In all cases, hedges with maturity mismatches will no longer be recognized when the hedges have a residual maturity of three months or less.
232. Where a recognized maturity mismatch exists, the value of the credit protection should be adjusted as follows:

$$P_a = P \times (t - 0.25) / (T - 0.25)$$

where:

- P_a = Value of credit protection adjusted for maturity mismatch
- P = Value of credit protection adjusted for haircuts for price volatility of collateral and currency mismatch (if applicable)
- t = min (T, residual maturity of credit protection) expressed in years
- T = min (5, residual maturity of the underlying exposure) expressed in years

XIV. Application of Scaling Factor

233. In determining the total risk-weighted amount under the IRB approach, the MA will apply a scaling factor (which could be either greater than or less than one) to the risk-weighted amount calculated for all IRB classes under the IRB approach (which does not apply to the CVA risk-weighted amount reported in Form MA(BS)3(III f)) (see also paragraph 42(iv)). The use of this scaling factor is to broadly maintain the aggregate level of minimum capital requirements derived from the revised capital adequacy framework.
234. The current best estimate of the scaling factor is 1.06. In applying this scaling factor, an AI should multiply the risk-weighted amount calculated under the IRB approach (which does not apply to the CVA risk-weighted amount reported in Form MA(BS)3(III f)) by 1.06 for the computation of the capital adequacy ratio.

Section C: Treatment of Expected Losses and Eligible Provisions under IRB Approach

I. Determination of Total EL Amount

235. An AI should sum the EL amount (i.e. $EL \times EAD$) attributed to its corporate, sovereign, bank and retail exposures (excluding hedged exposures under the double default framework⁴⁸) that are subject to the IRB approach to obtain a ***total EL amount***.

(A) EL for Exposures other than SL under Supervisory Slotting Criteria Approach

236. An AI should calculate the EL as $PD \times LGD$ for corporate, sovereign, bank and retail exposures which are not in default and not treated as hedged exposures under the double default framework. For corporate, sovereign, bank and retail exposures that are in default, an AI should use its best estimate of EL.

(B) EL for SL under Supervisory Slotting Criteria Approach

237. For SL under supervisory slotting criteria approach, EL amount is determined by multiplying by 8% the risk-weighted amount produced from the appropriate risk-weights as specified below:

Remaining maturity	Strong	Good	Satisfactory	Weak	Default
<u>SL (other than HVCRE exposures)</u>					
Equal or more than 2.5 years	5%	10%	35%	100%	625%
Less than 2.5 years	0%	5%	35%	100%	625%
<u>HVCRE exposures</u>					
All maturities	5%	5%	35%	100%	625%

238. Where an AI assigns preferential risk-weights to its SL under supervisory slotting criteria approach (other than HVCRE exposures and specified ADC exposures) in accordance with paragraph 76(a), then, for the purpose of calculating the risk-weighted amount of these SL, the AI may assign preferential risk-weights of 0% and 5% to the SL which falls within the “strong” and “good” grades respectively in calculating the EL amount.

⁴⁸ In general, most banks do not make provisions for the hedged portion of an exposure. Furthermore, the EL is dependent on the joint probability of default of the underlying obligor and the credit protection provider and would therefore be minimal. Under these circumstances, the EL for the hedged portion of an exposure is assumed to be zero.

II. Determination of Total Eligible Provisions

239. Total eligible provisions is defined as the sum of eligible provisions that are attributed to corporate, sovereign, bank and retail exposures (excluding hedged exposures under the double default framework) that are subject to the IRB approach, where eligible provisions means the sum of the AI's specific provisions, partial write-offs, regulatory reserve for general banking risks and **collective provisions** attributed to non-securitization exposures that are subject to the IRB approach and any discounts referred to in paragraphs 101 and 116 on the aforesaid IRB exposures that are in default, exclusive of any CVA and CVA loss.

(A) A Portion of Exposures subject to STC Approach to Credit Risk

240. An AI using **only the IRB approach, or both the IRB approach and the STC approach, to calculate** its credit **risk for non-securitization** exposures, either on a transitional basis, or on a permanent basis if the exposures subject to the STC approach are exempted from the IRB approach, should determine the portion of regulatory reserve for general banking risks and collective provisions that is attributed to exposures under the STC approach, IRB approach, **securitization internal ratings-based approach (SEC-IRBA), securitization external ratings-based approach (SEC-ERBA), securitization standardized approach (SEC-SA) and securitization fall-back approach (SEC-FBA)**. The treatment of such reserves and provisions attributed to exposures under **these approaches** is set out in the completion instructions of Form MA(BS)3(II) (see paragraphs 108 and 109), with elaborations on apportionment method in paragraphs 241 and 242.
241. An AI should attribute its total regulatory reserve for general banking risks and collective provisions on a pro-rata basis according to the proportion of the risk-weighted amount calculated by using the STC approach, IRB approach, **SEC-IRBA, SEC-ERBA, SEC-SA or SEC-FBA**, as the case requires (which does not include the risk-weighted amount for CVA and exposures to CCPs calculated under Part 6A of the Rules). However, with the prior consent of the MA, an AI may use its own method to apportion its total regulatory reserve for general banking risks and collective provisions among the various credit risk calculation approaches. For example, when one approach to determining the risk-weighted amount (e.g. STC approach or IRB approach) is used exclusively within an entity of the AI's consolidation group, the regulatory reserve for general banking risks and collective provisions booked within the entity using the STC approach may be attributed to exposures under the STC approach. Similarly, the regulatory reserve for general banking risks and collective provisions booked within an entity using the IRB approach may be attributed to the total eligible provisions as defined in paragraph 239.
242. The MA may, on a case-by-case basis, consider whether there are particular circumstances that justify an AI using its internal allocation methodology for allocating the reserves for general banking risks and collective provisions for recognition in capital under the STC approach, IRB approach, **SEC-IRBA, SEC-ERBA, SEC-SA and SEC-FBA**. An AI should obtain the MA's prior consent before such a method can be used.

III. Treatment of Total EL Amount and Total Eligible Provisions

243. An AI using the IRB approach should compare the amount of total eligible provisions (see paragraph 239) with the total EL amount (see paragraphs 235 to 238).
244. Where the total EL amount exceeds total eligible provisions, the AI should deduct the difference from its CET1 capital, in accordance with **section 43(1)(i)** of the Rules.
245. Where the total EL amount is less than total eligible provisions, the AI may include the difference in its Tier 2 capital, up to a maximum of 0.6% of the risk-weighted amount (excluding securitization exposures) calculated under the IRB approach (which does not include the risk-weighted amount for CVA and exposures to CCPs calculated under Part 6A of the Rules).

Section D: Specific Instructions

FORM: IRB_TOTCRWA

246. This form gives a summary of an AI's risk-weighted amount by IRB class/subclass calculated under the IRB approach and the risk-weighted amount for CVA calculated under Division 3 of Part 6A of the Rules (but excluding securitization exposures and exposures to CCPs calculated under Part 7 and Division 4 of Part 6A of the Rules respectively) and shows the effect of the scaling factor.

<u>Item</u>	<u>Nature of item</u>
Items 1 to 6	<p><u>Number of Corresponding Forms Reported under Division B (Column 1)</u></p> <p>For each IRB subclass, indicate the number of forms reported in Division B from which the figures reported under column (2) or (3) can be referred. If more than one form has been filed in Division B for an IRB subclass (see paragraphs 11 and 12), an AI should indicate the total number of forms reported for that particular IRB subclass. For example, under item 4, if an AI reports one form for RM to individuals, two forms for QRRE and two forms for other retail exposures to individuals, the AI should then report in column (1):</p> <ul style="list-style-type: none">- for item 4(a)(i): (1) Form IRB_RETAIL- for item 4(b): (2) Form IRB_RETAIL- for item 4(d): (2) Form IRB_RETAIL <p><u>Risk-weighted amount (Columns (2)-(4))</u></p> <p>Report the risk-weighted amount of the IRB classes/subclasses under the IRB approach.</p>
Item 7	<p><u>Total risk-weighted amount for credit risk (IRB approach) before applying the scaling factor</u></p> <p>This is the sum of items 1 to 6.</p>
Item 8	<p><u>Total risk-weighted amount for credit risk (IRB approach) after applying the scaling factor</u></p> <p>In calculating the total risk-weighted amount under the IRB approach, an AI should apply a scaling factor specified by the MA to the risk-weighted amount calculated under the IRB approach (i.e. item 7). The current best estimate of the scaling factor is <u>1.06</u>.</p>
Item 9	<p><u>Risk-weighted amount for CVA</u></p> <p>This is the sum of the risk-weighted amounts for CVA reported under Divisions A and B of Form MA(BS)3(III f).</p>
Item 10	<p><u>Total risk-weighted amount for credit risk (IRB Approach plus CVA)</u></p> <p>This amount equals to the sum of items 8 and 9. This is also the figure</p>

reported in item 2.3 of Division A of Form MA(BS)3(I).

A partial breakdown of the aggregate risk-weighted amount (before applying the scaling factor) is provided :

- Item 10(a): the risk-weighted amount of default risk exposures in respect of OTC derivative transactions, credit derivative contracts and SFTs that are not subject to the IMM(CCR) approach;
- Item 10(b): the risk-weighted amount of default risk exposures in respect of OTC derivative transactions, credit derivative contracts and SFTs that are subject to the IMM(CCR) approach; and
- Item 10(c): the risk-weighted amount of exposures to financial institutions that are subject to the asset value correlation multiplier.

FORM: IRB_CSB

247. This form is used for reporting the risk-weighted amount and credit risk components of corporate, bank and sovereign exposures (except SL under supervisory slotting criteria approach which should be reported in Form IRB_SLSLOT⁴⁹). In each reporting form, an AI should state whether the foundation IRB approach or advanced IRB approach is used, the IRB class and subclass for which the form is completed, and the portfolio type when more than one form is reported for an IRB subclass.

<u>Item</u>	<u>Nature of item</u>
Columns (1) & (2)	<p><u>Internal rating system</u></p> <p>An AI using the IRB approach is required to have a minimum of <u>seven</u> grades for non-defaulted obligors and <u>one</u> for defaulted obligors in its internal rating systems. The AI can insert additional grades into column (1) if its internal obligor grades are more than <u>eight</u>.</p> <p>Under column (2), enter “N” for a non-defaulted obligor grade and “D” for a defaulted obligor grade.</p> <p>The obligor grades should be presented in an ascending order of their associated average PD. For consistency purposes, an AI should report every obligor grade within its internal rating systems in each form even though there is no exposure falling within a particular obligor grade.</p>
Columns (3), (4) & (5)	<p><u>PD range</u></p> <p>An AI should report a distribution of PD bands as is currently used for internal purposes. For each obligor grade, report the <u>average PD</u> (in percentage) under column (5). This estimate will be used for calculation of the risk-weighted amount for each exposure.</p> <p>The average PD for corporate, sovereign and bank exposures that are not in default is the PD associated with the internal obligor grade to which that</p>

⁴⁹ To avoid doubt, this means that an AI should capture its HVCRE exposures under the foundation IRB approach or advanced IRB approach in Form IRB_CSB, and those under the supervisory slotting criteria approach in Form IRB_SLSLOT.

Item

Nature of item

exposure is assigned, with a PD floor for corporate and bank exposures of 0.03%. For defaulted exposures, the average PD for corporate, sovereign and bank exposures is 100%.

Report the lower bound and upper bound of the PD band for each obligor grade under columns (3) and (4) respectively. The average PD must lie between the lower and upper boundaries. Where an AI uses a single PD estimate for each obligor grade (i.e. no PD range), it should enter the same PD estimate as the upper and lower bounds of the range (i.e. the same PD estimates for all columns (3), (4) and (5)).

In cases where an AI calculates its risk-weighted amount for both default risk and dilution risk of its purchased corporate receivables, only the PD estimate for default risk should be reported.

Columns (6) to (11)

EAD calculation

For each obligor grade, give a breakdown of the exposures before recognized guarantees/credit derivative contracts by:

- for columns (6)(i) and (6)(ii): on-balance sheet exposures before and after netting (if not covered by a valid bilateral netting agreement, the gross amount of an exposure should be reported in both columns)
- for column (7): off-balance sheet exposures (Other than OTC derivative transactions, credit derivative contracts and SFTs)
- for column (8): OTC derivative transactions, credit derivative contracts and SFTs (after adjusting for the credit risk mitigating effect of a valid bilateral netting agreement or valid cross-product netting agreement, if any)

An AI is required to provide the breakdown of the EAD derivation of off-balance sheet exposures in Division D for exposures other than OTC derivative transactions, credit derivative contracts and SFTs, and Division E for OTC derivative transactions, credit derivative contracts and SFTs. Specific reporting requirements for off-balance sheet exposures are given in the specific instructions for Form IRB_OBSND, Form IRB_OBSD_N_IMM and Form IRB_OBSD_IMM.

Exposures with guarantees/credit derivative contracts recognized under the substitution framework should be reported as follows:

Foundation IRB approach

- (i) Identify the IRB subclass of an exposure and report the amount of the exposure before recognized guarantees/credit derivative contracts under columns (6) to (8) in the grade applicable to the PD estimate of the underlying obligor.
- (ii) Divide the exposure amount into two portions: (a) the portion covered by credit protection and (b) the remaining uncovered portion.

Item

Nature of item

- (iii) Report the uncovered portion as “Exposures after recognized guarantees/credit derivative contracts” under columns (9) to (11) of the same form, in the grade applicable to the PD estimate of the underlying obligor.
- (iv) Report the secured portion as “Exposures after recognized guarantees/credit derivative contracts” under columns (9) to (11) of the form for the IRB subclass applicable for the credit protection provider and in the grade applicable to the PD estimate of the credit protection provider (i.e. PD substitution).

Advanced IRB approach

- (i) Identify the IRB subclass of an exposure and report the amount of the exposure before recognized guarantees/credit derivative contracts under columns (6) to (8) in the grade applicable to the PD estimate of the underlying obligor.
- (ii) Where the risk mitigating effects are addressed through
 - PD substitution: report in the way similar to the foundation IRB approach;
 - adjusting the PD estimate of the obligor: report the same exposure amount under columns (9) to (11) of the same form in a grade applicable to the adjusted PD estimate of the underlying obligor; or
 - adjusting the LGD estimate: report the same exposure amount under columns (9) to (11) of the same form and in the grade applicable to the PD estimate of the underlying obligor.

Exposures with guarantees/credit derivative contracts recognized under the double default framework should be reported as follows:

- (i) Identify the IRB subclass of an exposure and report the amount of the exposure before recognized guarantees/credit derivative contracts under columns (6) to (8) in the grade applicable to the PD estimate of the underlying obligor.
- (ii) Divide the exposure amount into two portions: (a) the hedged portion covered by credit protection and (b) the remaining unhedged portion. In respect of the hedged portion, the risk-weighted amount should be calculated according to the risk-weight function set out in paragraph 62 (or, where applicable, adjusted by paragraph 66(ii) in respect of SME corporates; paragraph 67 in respect of exposures to financial institutions that are subject to the asset value correlation multiplier; or paragraph 73(i) in respect of HVCRE exposures). The risk-weighted amount of the unhedged exposure should be calculated in the same way as for all other corporate exposures to the same obligor of the underlying

ItemNature of item

exposure according to the risk-weight function set out in paragraph 60 (or, where applicable, adjusted by paragraph 66(i) in respect of SME corporates; paragraph 67 in respect of exposures to financial institutions that are subject to the asset value correlation multiplier; or paragraph 73(i) in respect of HVCRE exposures).

- (iii) Report both hedged and unhedged portions as “Exposures after recognized guarantees/credit derivative contracts” under columns (9) to (11) of the same form in the grade applicable to the PD estimate of the underlying obligor.

Defaulted exposures cannot be subject to the double default framework. In case the underlying obligor of a hedged exposure defaults, such exposure should be treated as a direct exposure to the credit protection provider and then risk-weighted accordingly. Conversely, if the credit protection provider of a hedged exposure defaults, such exposure should remain with the underlying obligor and should be risk-weighted as an unhedged exposure to the underlying obligor. In case both the underlying obligor and the credit protection provider of a hedged exposure default, such exposure should be treated as a defaulted exposure to either the underlying obligor or the credit protection provider, depending on which party defaulted last.

For exposures without recognized guarantees/credit derivative contracts or without taking into account the credit risk mitigating effect of recognized guarantees/credit derivative contracts, the same exposure amount should be entered in both columns (6)(ii) to (8) and (9) to (11).

Column (12) EAD

This is the sum of columns (9) to (11), which is the EAD figure for calculating the risk-weighted amount of an exposure.

Column (13) Exposure weighted average LGD

LGD is reported in percentage.

$$\text{Exposure weighted average LGD} = \sum_i \text{LGD}_i \times \text{EAD}_i / \sum_i \text{EAD}_i$$

where:

LGD_i = the LGD associated with the i^{th} exposure in a grade.

EAD_i = the EAD associated with the i^{th} exposure allocated to a grade.

The percentage reported in column (13) should agree with column (12) of Form IRB_FIRBLGD or column (19) of Form IRB_AIRBLGD, where applicable.

<u>Item</u>	<u>Nature of item</u>
Column (14)	<p><u>Exposure weighted average maturity value</u></p> <p>M is reported in years.</p> $\text{Exposure weighted average maturity value} = \sum_i M_i \times \text{EAD}_i / \sum_i \text{EAD}_i$ <p>where:</p> <p>M_i = the M associated with the i^{th} exposure in a grade.</p> <p>EAD_i = the EAD associated with the i^{th} exposure allocated to a grade.</p>
Columns (15) to (18)	<p><u>Risk-weighted amount</u></p> <p>Calculate the risk-weighted amount of <u>each</u> exposure and report the sum of risk-weighted amount (including the risk-weighted amount under the double default framework and for dilution risk and residual value risk, where applicable) for each obligor grade under column (15).</p> <p>Report under column (16) the risk-weighted amount of hedged exposures that are calculated according to the risk-weight function set out in paragraph 62 (or, where applicable, adjusted by paragraph 66(ii) in respect of SME corporates; paragraph 67 in respect of exposures to financial institutions that are subject to the asset value correlation multiplier; or paragraph 73(i) in respect of HVCRE exposures) under the double default framework.</p> <p>Report under column (17) the risk-weighted amount for dilution risk for purchased receivables.</p> <p>Report under column (18) the risk-weighted amount for residual value risk for leasing transactions.</p>
Columns (19) & (20)	<p><u>Memorandum items</u></p> <p>Report under column (19) the sum of the <i>expected loss amount</i> of exposures for each obligor grade.</p> <p>Report under column (20) the total number of obligors and credit protection providers for the exposures reported in column (12) for each obligor grade.</p>
Columns (6) to (12), & (15) to (20)	<p><u>Exposures subject to asset value correlation multiplier</u></p> <p>Report under columns (6) to (12) and (15) to (20) the AI's exposures to financial institutions that are subject to the asset value correlation multiplier.</p>

FORM: IRB_SLSLOT

248. This form is used for reporting SL under supervisory slotting criteria approach. In each reporting form, an AI should specify the SL subclass for which the form is completed.

ItemNature of itemColumns (1)
& (2)Internal rating system

An AI using the supervisory slotting criteria approach for SL is required to map its internal grades for the SL into five supervisory rating grades: “strong”, “good”, “satisfactory”, “weak” and “default”, each of which is assigned a supervisory risk-weight (SRW) as given in column (2), whilst the values of SRWs displayed depend on the IRB subclass selected for input:

- when an IRB subclass other than “specialized lending (high-volatility commercial real estate)” is selected for input, column (2) will show the SRWs applicable to specialized lending (other than HVCRE exposures) as set out in column (A) of the table below;
- when the IRB subclass of “specialized lending (high-volatility commercial real estate)” is selected for input, column (2) will show the SRWs applicable to HVCRE exposures, as set out in column (B) of the table below.

Supervisory rating grades	SRW (%) applicable to SL (other than HVCRE exposures) (A)	SRW (%) applicable to HVCRE exposures (B)
STRONG (a)	50	70
STRONG	70	95
GOOD (a)	70	95
GOOD	90	120
SATISFACTORY	115	140
WEAK	250	250
DEFAULT	0	0

Note: Supervisory rating grades marked by “(a)” denote preferential risk-weights. The preferential risk-weights under column (A) do not apply to specified ADC exposure.

Columns (3)
to (8)EAD calculation

For each supervisory rating grade, give a breakdown of the exposures before recognized guarantees/credit derivative contracts by:

- for columns (3)(i) and (3)(ii): on-balance sheet exposures before and after netting (if not covered by a valid bilateral netting agreement, the gross amount of an exposure should be reported in both columns)
- for column (4): off-balance sheet exposures (Other than OTC derivative transactions, credit derivative contracts and SFTs)
- for column (5): OTC derivative transactions, credit derivative contracts and SFTs (after adjusting for the credit risk mitigating effect of a valid bilateral netting agreement or valid cross-product netting agreement, if any)

An AI is required to provide the breakdown of the EAD derivation of off-balance sheet exposures in Division D for exposures other than OTC derivative transactions, credit derivative contracts and SFTs, and Division E for OTC derivative transactions, credit derivative contracts and SFTs. Specific reporting requirements for off-balance sheet exposures are given in the specific instructions for Form IRB_OBSND, Form IRB_OBSD_N_IMM and Form IRB_OBSD_IMM.

<u>Item</u>	<u>Nature of item</u>
	<p>Exposures <u>with</u> recognized guarantees/credit derivative contracts should be reported as below:</p> <ul style="list-style-type: none"> (i) Identify the IRB subclass of a SL and report the exposure amount before guarantees/credit derivative contracts under columns (3) to (5) in the supervisory rating grade applicable to the obligor. (ii) Divide the exposure amount into two portions: (a) the portion secured by credit protection; and (b) the remaining unsecured portion. (iii) Report the uncovered portion as “Exposures after recognized guarantees/credit derivative contracts” under columns (6) to (8) of the same form, in the supervisory rating grade applicable to the obligor. (iv) Report the secured portion as “Exposures after recognized guarantees/credit derivative contracts” under relevant columns of the applicable form for the IRB subclass applicable for the credit protection provider and in the grade applicable to the PD estimate of the credit protection provider (i.e. PD substitution). <p>No double default framework is available for SL under supervisory slotting criteria approach.</p> <p>For exposures <u>without</u> recognized guarantees/credit derivative contracts or <u>without</u> taking into account the credit risk mitigating effect of recognized guarantees/credit derivative contracts, the same exposure amount should be entered in both columns (3)(ii) to (5) and (6) to (8).</p>
Column (9)	<p><u>EAD</u></p> <p>This is the sum of columns (6) to (8), which is the EAD figure for calculating the risk-weighted amount of an exposure.</p>
Column (10)	<p><u>Exposure weighted average maturity value</u></p> <p>Specific instructions for column (14) of Form IRB_CSB apply. The supervisory estimates of M under the foundation IRB approach are not applicable to SL under supervisory slotting criteria approach.</p>
Column (11)	<p><u>Risk-weighted amount</u></p> <p>This is calculated as follows: SRW (column (2)) x EAD (column (9)).</p>
Columns (12) & (13)	<p><u>Memorandum items</u></p> <p>Report the sum of the expected loss amount of exposures for each supervisory rating grade under column (12).</p> <p>Report under column (13) the total number of obligors and credit protection providers for the exposures reported in column (9) for each supervisory rating grade.</p>

FORM: IRB_RETAIL

249. This form is used for reporting the different IRB subclasses of retail exposures. In each reporting form, an AI should state the retail IRB subclass for which the form is completed, and the portfolio type when more than one form is reported for an IRB subclass.

<u>Item</u>	<u>Nature of item</u>
Columns (1) & (2)	<p><u>Internal rating system</u></p> <p>There is <u>no</u> minimum number of pools for retail exposures.</p> <p>Under column (2), enter “N” for a non-defaulted pool and “D” for a defaulted pool. The pools should be presented in an ascending order of their associated average PD. For consistency purposes, an AI should report every obligor grade within its internal rating systems in each form even though there is no exposure falling within a particular obligor grade.</p>
Columns (3), (4) & (5)	<p><u>PD range</u></p> <p>An AI should report a distribution of PD bands as is currently used for internal purposes. For each pool (i.e. PD band), report the <u>average PD</u> (in percentage) under column (5). This estimate will be used for calculation of risk-weighted amount of each pool.</p> <p>The average PD for retail exposures that are not in default should not be less than <u>0.03%</u>. For defaulted exposures, the average PD is <u>100%</u>.</p> <p>Report the <u>lower bound</u> and <u>upper bound</u> of the PD band for each pool under columns (3) and (4) respectively. The average PD must lie between the lower and upper boundaries. Where an AI uses a PD estimate for each pool (i.e. no PD range), it should enter the same PD estimate as the upper and lower bounds of the range (i.e. the same PD estimates for all columns (3), (4) and (5)).</p> <p>In cases where an AI calculates its risk-weighted amount for both default risk and dilution risk of its purchased retail receivables, only the PD estimate for default risk should be reported.</p>

Columns (17) & (18)	<p><u>Memorandum items</u></p> <p>Report under column (17) the sum of the expected loss amount of exposures for each pool.</p>

<u>Item</u>	<u>Nature of item</u>
	Report under column (18) the total number of obligors and credit protection providers for the exposures reported in column (12) for each pool.

FORM: IRB_EQUSRW

250. This form is used for reporting the risk-weighted amount of equity exposures that are subject to the simple risk-weight method other than those equity exposures reported in Form IRB_EQUO.

<u>Item</u>	<u>Nature of item</u>
Columns (1) & (2)	<u>Portfolio</u> An AI having equity exposures subject to the simple risk-weight method is required to divide such exposures into two portfolios: (i) publicly traded equity exposures and (ii) all other equity exposures. These portfolios are assigned with a supervisory risk-weight of 300% and 400% respectively.
Columns (3) & (4)	<u>EAD Calculation</u> For each portfolio, report the exposure amount before netting (column (3)) and the exposure amount after netting (column (4)). Where an exposure is not covered by any valid bilateral netting agreement or valid cross-product netting agreement, the same amount should be entered in both columns.
Column (5)	<u>Risk-weighted amount</u> This is calculated as follows: SRW (column (2)) x EAD (column (4)).
Column (6)	<u>Memorandum item</u> Report the number of equity exposures reported under publicly traded equity exposures and all other equity exposures.

FORM: IRB_EQUINT

251. This form is used for reporting the risk-weighted amount of equity exposures that are subject to the internal models method other than those equity exposures reported in Form IRB_EQUO.

<u>Item</u>	<u>Nature of item</u>
Column (1)	<u>Portfolio</u> An AI having equity exposures subject to the internal models method is required to divide such exposures into two portfolios: (i) publicly traded equity exposures and (ii) all other equity exposures.
Column (2) & (3)	<u>EAD calculation</u>

<u>Item</u>	<u>Nature of item</u>
	Specific instructions for columns (3) and (4) of Form IRB_EQUSRW apply.
Columns (4) to (6)	<p><u>Risk-weighted amount calculation: minimum risk-weights</u></p> <p>Under column (4), report the EAD of the equity exposures for which the minimum risk-weights are applied in calculating the risk-weighted amount, which are 200% for publicly traded equity exposures and 300% for all other equity exposures.</p> <p>Under column (6), the amount of risk-weighted amount of the equity exposures where the minimum risk-weights are applied is calculated as follows: EAD (column (4)) x minimum risk-weight (column (5)).</p>
Columns (7) to (9)	<p><u>Risk-weighted amount calculation: internal models</u></p> <p>Under column (7), report the EAD of the equity exposures whose risk-weighted amount is calculated using the internal models and where the minimum risk-weights are not applicable.</p> <p>Under column (8), report the potential loss on the equity exposures from an assumed instantaneous shock equivalent to the one-tailed 99% confidence interval of the difference between quarterly returns and an appropriate risk-free rate computed over a long-term sample period.</p> <p>Under column (9), the risk-weighted amount of the equity exposures is calculated as follows: potential loss (column (8)) x 12.5).</p>
Column (10)	<p><u>Risk-weighted amount</u></p> <p>This is the sum of the risk-weighted amount calculated under the minimum risk-weights (column (6)) and under the internal models (column (9)).</p>
Column (11)	<p><u>Memorandum item</u></p> <p>Report the number of equity exposures reported under publicly traded equity exposures and all other equity exposures.</p>

FORM: IRB_EQUPDLGD

252. This form is used for reporting the risk-weighted amount and credit risk components of equity exposures subject to the PD/LGD approach other than those equity exposures reported in Form IRB_EQUO. In each reporting form, an AI should state the IRB subclass for which the form is completed, and also the portfolio type when more than one form is reported for an IRB subclass.

<u>Item</u>	<u>Nature of item</u>
Columns (1) to (5)	<p><u>Internal rating system: obligor grade and PD range</u></p> <p>Specific instructions for columns (1) to (5) of Form IRB_CSB apply.</p>

<u>Item</u>	<u>Nature of item</u>
Columns (6) & (7)	<p><u>EAD calculation</u></p> <p>For each obligor grade, give a breakdown of exposures (there being no distinction required between on-balance sheet exposures and off-balance sheet exposures in relation to equity exposures) before recognized guarantees/credit derivative contracts by exposures before and after netting for columns (6)(i) and (ii) (if not covered by a valid bilateral netting agreement or valid cross-product netting agreement, the gross amount of an exposure should be reported in both columns).</p> <p>Exposures <u>with</u> recognized guarantees/credit derivative contracts should be reported as follows:</p> <ol style="list-style-type: none"> (i) Identify the IRB subclass of an exposure and report the amount of the exposure before recognized guarantees/credit derivative contracts under column (6) in the grade applicable to the PD estimate of the underlying obligor. (ii) Divide the exposure amount into two portions: (a) the portion covered by credit protection and (b) the remaining uncovered portion. (iii) Report the uncovered portion as “Exposures after recognized guarantees/credit derivative contracts” under column (7) of the same form, in the grade applicable to the PD estimate of the underlying obligor. (iv) Report the secured portion as “Exposures after recognized guarantees/credit derivative contracts” under, say, columns (9) to (11) of the IRB_CSB or IRB_RETAIL, as the case may be, for the IRB subclass applicable for the credit protection provider and in the grade applicable to the PD estimate of the credit protection provider (i.e. PD substitution). <p>For exposures <u>without</u> recognized guarantees/credit derivative contracts or <u>without</u> taking into account the credit risk mitigating effect of recognized guarantees/credit derivative contracts, the same exposure amount should be entered in both columns (6)(ii) and (7).</p>
Columns (8) to (11)	<p><u>Risk-weighted amount</u></p> <p>Calculate the risk-weighted amount of <u>each</u> exposure and report the sum of risk-weighted amount for each grade under column (8).</p> <p>An AI should report the supplementary information on the risk-weighted amount reported under column (8):</p> <ul style="list-style-type: none"> - for column (9): report the risk-weighted amount of the equity exposures where the factor of 1.5 is applied to the risk-weight derived from the corporate risk-weight function. - for column (10): report the risk-weighted amount of the equity exposures where the minimum risk-weight is applied (i.e. 100% for publicly traded equity exposures and privately owned equity exposures held for long-

<u>Item</u>	<u>Nature of item</u>
	term investment, 200% for other publicly traded equity exposures and 300% for other equity exposures).
	- for column (11): report the risk-weighted amount of the equity exposures where the risk-weight of 1250% is applied.
Column (12) & (13)	<u>Memorandum item</u> Report the sum of the expected loss amount of exposures for each grade under column (12). Report the number of equity exposures reported for each grade under column (13).

FORM: IRB_EQUO

253. This form is used for reporting the risk-weighted amount of specified equity exposures subject to prescribed supervisory risk-weights and are not reported in Form IRB_EQUSRW, Form IRB_EQUINT or Form IRB_EQUPDLGD. These include:
- (i) equity exposures to financial sector entities as specified under paragraph 120;
 - (ii) equity exposures to commercial entities as specified under paragraph 119; and
 - (iii) the EL amount of equity exposures subject to the PD/LGD approach as specified under paragraph 130.

<u>Item</u>	<u>Nature of item</u>
Columns (1) & (2)	<u>Portfolio</u> An AI should report equity exposures that fall within paragraph 253.
Columns (3) & (4)	<u>EAD Calculation</u> For each portfolio, report the exposure amount before netting (column (3)) and the exposure amount after netting (column (4)). Where an exposure is not covered by any valid bilateral netting agreement or valid cross-product netting agreement, the same amount should be entered in both columns.
Column (5)	<u>Risk-weighted amount</u> This is calculated as follows: SRW (column (2)) x EAD (column (4)).
Column (6)	<u>Memorandum item</u> Report the number of equity exposures reported under each of the portfolios of equity exposures reported in this Form.

FORM: IRB_OTHER

254. This form is used for reporting the risk-weighted amount of cash items and other items that are not reported elsewhere in the return.

<u>Item</u>	<u>Nature of item</u>
Column (1)	<p><u>Cash items</u></p> <p>An AI is required to report any cash item listed in the table under paragraph 134.</p> <p><u>Other items</u></p> <p>An AI is required to report any other item listed in the table under paragraph 135.</p> <p>The AI should provide a brief description of other items that are not specifically identified elsewhere in this return.</p>
Columns (3) & (4)	<p><u>EAD calculation</u></p> <p>An AI is required to report both the exposure amount before and after netting in columns (3) and (4) respectively. Where an item is not covered by a valid bilateral netting agreement or valid cross-product netting agreement, the same exposure amount should be entered in both columns.</p>
Column (5)	<p><u>Risk-weighted amount</u></p> <p>This is calculated as follows: EAD (column (4)) x SRW (column (2)).</p>

FORM: IRB_FIRBLGD

255. This form is used for reporting the LGD information for corporate, sovereign and bank exposures under the foundation IRB approach. For each form (IRB_CSB) reported under Division B for corporate, sovereign and bank exposures under the foundation IRB approach (except SL under supervisory slotting criteria approach), an AI should file a corresponding form under IRB_FIRBLGD.
256. In each reporting form of IRB_FIRBLGD, an AI should state the IRB class and subclass for which the form is completed, and also the portfolio type where more than one form is reported for an IRB subclass.

<u>Item</u>	<u>Nature of item</u>
Columns (1) & (2)	<p><u>Obligor grade</u></p> <p>Report the average PD for exposures assigned to each grade. The number of grades and the average PD figures reported should be the same as those reported in column (5) of Form IRB_CSB for that particular IRB subclass/portfolio type.</p>
Column (3)	<p><u>EAD</u></p> <p>Report the sum of EAD for exposures of each grade. This figure should be the same as column (12) of Form IRB_CSB for that particular IRB subclass/portfolio type.</p>

<u>Item</u>	<u>Nature of item</u>
Columns (4) to (11)	<p><u>LGD</u></p> <p>Allocate or apportion the EAD of each exposure according to the following facility/collateral types:</p> <p>Column (4): Exposures with <i>specific wrong-way risk</i> (LGD: 100%)</p> <p>Column (5): Subordinated exposures (LGD: 75%)</p> <p>Column (6): Unsecured senior exposures (LGD: 45%)</p> <p>Column (7): Other recognized IRB collateral (LGD: 40%)</p> <p>Column (8): Recognized commercial real estate (LGD: 35%)</p> <p>Column (9): Recognized residential real estate (LGD: 35%)</p> <p>Column (10): Recognized financial receivables (LGD: 35%)</p> <p>Column (11): Recognized financial collateral (LGD: 0%)</p> <ul style="list-style-type: none"> • If the exposure falls within paragraphs 87 or 88 (i.e. it is an exposure with specific wrong-way risk), report the full amount of EAD under column (4). • If the exposure is a subordinated exposure that is not captured under column (4), report the full amount of EAD under column (5). • If the exposure is an unsecured senior exposure that is not captured under column (4), report the full amount of EAD under column (6). • If a senior exposure is collateralized by recognized financial collateral (including gold), then the AI should enter the collateralized portion after the haircut adjustments (i.e. the greater of zero or E-E*) in column (11). The uncollateralized portion (E*) should be reported in column (4) or (6). • For senior exposures collateralized by recognized CRE or recognized RRE, if the exposure is 140% covered by collateral, 100% of the exposure should be reported in column (8) or (9), as the case may be. For exposures which are less well covered by collateral but meet a minimum coverage of 30%, the following proportion of the exposures should be reported in column (8) or (9): <ul style="list-style-type: none"> - $(\text{percentage of exposure collateralized} / 140\%) \times \text{EAD}$ <p>The remainder should be reported in column (4) or (6).</p> • For senior exposures collateralized by recognized financial receivables, if an AI has an exposure that is 125% covered by collateral then it should report 100% of the exposure in column (10). For an exposure which is less well covered by collateral, the following proportion of the exposure should be reported in column (10): <ul style="list-style-type: none"> - $(\text{percentage of exposure collateralized} / 125\%) \times \text{EAD}$

<u>Item</u>	<u>Nature of item</u>
-------------	-----------------------

The remainder should be reported in column (4) or (6).

- For senior exposures collateralized by **other recognized IRB collateral**, if the exposure is 140% covered by collateral, 100% of the exposure should be reported in column (7). For an exposure which is less well covered by collateral but meet a minimum coverage of 30%, the following proportion of the exposure should be reported in column (7):

$$- \quad (\text{percentage of exposure collateralized} / 140\%) \times \text{EAD}$$

The remainder should be reported in column (4) or (6).

Column (12)	<u>Exposure weighted average LGD</u>
-------------	--------------------------------------

Report the exposure weighted average LGD for each obligor grade. These figures should be the same as those reported under column (13) of Form IRB_CSB for that particular IRB subclass/portfolio type.

FORM: IRB_AIRBLGD

257. This form is used for reporting the LGD information for corporate, sovereign and bank exposures under the advanced IRB approach. For each form (IRB_CSB) reported under Division B for corporate, sovereign and bank exposures under the advanced IRB approach (except SL under supervisory slotting criteria approach), an AI should file a corresponding form under IRB_AIRBLGD.

258. In each reporting form of IRB_AIRBLGD, an AI should state the IRB class and subclass for which the form is completed, and also the portfolio type where more than one form are reported for an IRB subclass.

<u>Item</u>	<u>Nature of item</u>
-------------	-----------------------

Columns (1) & (2)	<u>Obligor grade</u>
----------------------	----------------------

Report the average PD for exposures assigned to each obligor grade. The number of obligor grades and the average PD figures reported should be the same as those reported in column (5) of Form IRB_CSB for that particular IRB subclass/portfolio type.

Column (3)	<u>EAD</u>
------------	------------

Report the sum of EAD for exposures of each grade. These figures should be the same as those reported under column (12) of Form IRB_CSB for that particular IRB subclass/portfolio type.

Columns (4) to (18)	<u>LGD</u>
------------------------	------------

Allocate or apportion the EAD of each exposure according to the **facility grades** (i.e. columns (4) to (18)), each of which is associated with a specified LGD. An AI should specify the percentage of LGD under each facility grade, together with a brief description where possible except that

<u>Item</u>	<u>Nature of item</u>
	the value of LGD in column (18) (or the last column under this item if dynamic rows are inserted after column (17)) is set at 100%.
Column (19)	<u>Exposure weighted average LGD</u> Report the exposure weighted average LGD for each grade. These figures should be the same as those reported under column (13) of Form IRB_CSB for that particular IRB subclass/portfolio type.

FORM: IRB_OBSND

259. This form is used for reporting the breakdown of off-balance sheet exposures other than OTC derivative transactions, credit derivative contracts and SFTs for corporate, sovereign, bank and retail exposures. For corporate, sovereign and bank exposures, an AI using the foundation IRB approach to derive the risk-weighted amount for these exposures should report information under (A1) and those using the advanced IRB approach should report information under (A2). (B) is for reporting of retail exposures.

<u>Item</u>	<u>Nature of item</u>
Items (1) to (11)	<p><u>Off-balance sheet exposures (Other than OTC derivative transactions, credit derivative contracts and SFTs)</u></p> <p>An AI is required to report in items 1 to 11 each of its off-balance sheet exposures other than OTC derivative transactions, credit derivative contracts and SFTs as listed in the table under paragraph 161.</p> <p>Exposures reported in item 11 may include the credit exposures to persons holding collateral posted by the AI (other than collateral posted for centrally cleared trades and held by CCPs) in a manner that is not bankruptcy remote from the persons.</p> <p>An AI should provide, in all cases, the principal amount and credit equivalent amount of the exposures before and after recognized guarantees/credit derivative contracts. The AI is also required to estimate CCFs for those types without prescribed CCFs. For such types of off-balance sheet exposures, the AI is required to indicate the CCF (or a representative value of a range of CCFs).</p>
Items (C _T & D _T)	<p><u>Total credit equivalent amount</u></p> <p>Report in item C_T the sum of the credit equivalent amount (before recognized guarantees/credit derivative contracts) reported in items 1 to 11.</p> <p>Report in item D_T the sum of the credit equivalent amount (after recognized guarantees/credit derivative contracts) reported in items 1 to 11.</p>

FORM: IRB_OBSD_N_IMM

260. This form is used for reporting the breakdown of the default risk exposures of OTC derivative transactions, credit derivative contracts and SFTs⁵⁰ (including centrally cleared trades that are treated as bilateral trades) for corporate, sovereign, bank and retail exposures that are not subject to the IMM(CCR) approach. Where provided for in this form, such off-balance sheet exposures should be reported by residual maturity of (i) one year or less; (ii) over 1 year to 5 years; and (iii) over 5 years.

<u>Item</u>	<u>Nature of item</u>
Items 1 to 12	<p><u>OTC derivative transactions, credit derivative contracts and SFTs</u></p> <p>An AI is required to report in items 1 to 11 each of its OTC derivative transactions (other than LSTs), credit derivative contracts (other than LSTs), SFTs (other than LSTs) and LSTs (regardless of the nature of the LSTs) by IRB class as well as (where required) by maturity time bands.</p> <p>AIs should report relevant exposures that are not subject to valid bilateral netting agreements or those that are required to be treated as a separate netting set under section 226J(1) of the Rules in items 1 to 8. Relevant exposures that are subject to valid bilateral netting agreements and do not fall within section 226J(1) of the Rules should be reported in items 9 to 11. For capital adequacy purposes, only default risk exposures of OTC derivative transactions and credit derivative contracts may be reported on a net basis.</p> <p>Those OTC derivative transactions, credit derivative contracts, SFTs and LSTs that do not fall within items 1 to 11 are reported in item 12.</p> <p>For reporting of OTC derivative transactions and credit derivative contracts (other than LSTs arising from the transactions or contract) in items 1 to 6 and 9, an AI should provide, in all cases, the principal amount, current exposure, potential exposure and default risk exposure of the exposures before and after recognized guarantees/credit derivative contracts.</p> <p>For reporting of SFTs (other than LSTs) and LSTs in items 7, 8, 10 and 11 and exposures in item 12, an AI should provide, in all cases, the principal amount (which, in respect of SFTs, is the aggregate principal amount of the securities sold or lent, or the money paid or lent, or the securities or money provided as collateral, under the SFTs) and default risk exposure of the exposures before and after recognized guarantees/credit derivative contracts (but after netting in both instances).</p>
Items A(iv) & A(v)	<p><u>Subtotal default risk exposures</u></p> <p>Report in item A(iv) the sum of the default risk exposures (before recognized guarantees/credit derivative contracts) reported in items 1 to 5.</p> <p>Report in item A(v) the sum of the default risk exposures (after recognized guarantees/credit derivative contracts) reported in items 1 to 5.</p>

⁵⁰ The exposures covered include LSTs arising from OTC derivative transactions, credit derivative contracts and SFTs – see their respective definitions under section 2(1) of the Rules.

<u>Item</u>	<u>Nature of item</u>
Items	<u>Total default risk exposures</u>
B(iv) & B(v)	<p>Report in item B(iv) the sum of the default risk exposures (before recognized guarantees/credit derivative contracts but (where applicable) after netting) reported in items 1 to 12 for different IRB classes.</p> <p>Report in item B(v) the sum of the default risk exposures (after recognized guarantees/credit derivative contracts and (where applicable) netting) reported in items 1 to 12 for different IRB classes.</p>

FORM: IRB_OBSD_IMM

261. This form is used for reporting the breakdown of the default risk exposures of OTC derivative transactions, credit derivative contracts and SFTs⁵⁰ (including centrally cleared trades that are treated as bilateral trades) for corporate, sovereign, bank and retail exposures under the IMM(CCR) approach. An AI should refer to paragraphs 148(a) and 182 to 185 and report in this form for different IRB classes the principal amounts and default risk exposures of OTC derivative transactions, credit derivative contracts and SFTs that are associated with the *higher* of the portfolio-level risk-weighted amount of the relevant exposures referred to in paragraph 183(i) and (ii).

<u>Item</u>	<u>Nature of item</u>
Items (1) to (7)	<p>OTC derivative transactions, credit derivative contracts and SFTs</p> <p>An AI is required to report in items 1 to 7 each of its OTC derivative transactions and credit derivative contracts (other than LSTs), SFTs (other than LSTs) and LSTs (regardless of the nature of the LSTs) by IRB class. AIs should report relevant exposures that are not subject to valid bilateral netting agreements or valid cross-product netting agreements, or exposures that are required to be treated as a separate netting set under section 226J(1) of the Rules, in items 1 to 3 as appropriate. Relevant exposures that are subject to valid bilateral netting agreements or valid cross-product netting agreements and which do not fall within section 226J(1) of the Rules should be reported in items 4 to 7 as appropriate.</p> <p>An AI should provide, in all cases, the principal amount (which, in respect of SFTs, is the aggregate principal amount of the securities sold or lent, or the money paid or lent, or the securities or money provided as collateral, under the SFTs) and default risk exposure of the transactions before and after recognized guarantees/credit derivative contracts (but after netting in both instances).</p>
Items	<u>Total default risk exposures</u>
(B(ii) & B(iii))	Report in item B(ii) the sum of the default risk exposures (before recognized guarantees/credit derivative contracts but after netting) reported in items 1 to 7 for different IRB classes.

<u>Item</u>	<u>Nature of item</u>
-------------	-----------------------

Report in item B(iii) the sum of the default risk exposures (after recognized guarantees/credit derivative contracts and netting) reported in items 1 to 7 for different IRB classes.

FORM: IRB_ELEP

262. This form is used for reporting the EL amount and eligible provisions by IRB class/subclass and calculating the difference between the total EL amount and total eligible provisions (if any) for the computation of capital base.

<u>Item</u>	<u>Nature of item</u>
-------------	-----------------------

Items (1) to (4)	<u>Corporate, sovereign, bank and retail exposures</u>
------------------	--

An AI should report by IRB class/subclass the EL amount and eligible provisions for non-defaulted exposures (columns (a) and (d)) and defaulted exposures (columns (b) and (e)).

Item (5)	<u>Total</u>
----------	--------------

This is the sum of items (1) to (4).

Items (6) to (9)	<u>EL-EP calculation</u>
------------------	--------------------------

Excess of total EL amount over total eligible provisions will be reported in item 6. This figure will be deducted from an AI's CET1 capital, in accordance with **section 43(1)(i)** of the Rules (see Form MA(BS)3(II)).

Surplus of total eligible provisions over total EL amount will be reported in item 7. This figure will be compared to a ceiling reported in item 8 (i.e. $0.6\% \times \text{item 8 of Form IRB_TOTCRWA}$) and then the lower amount is reported in item 9. This figure will be added to an AI's Tier 2 capital (see Form MA(BS)3(II)).

Hong Kong Monetary Authority
March **2018**

Annex IIIc-A: Illustrations

- Below are some illustrative examples for the calculation of the risk-weighted amounts under the foundation IRB approach. These examples are reported in the attached returns for Bank XYZ.

(A) Corporate, Sovereign and Bank Exposures

- For simplicity reasons, Bank XYZ is assumed to have one internal rating system for all of its corporate, sovereign and bank exposures. This internal rating system comprises 8 obligor grades, each associated with a PD estimate as given in Tables A and B below. Table A gives the risk-weights for SME Corporates while Table B gives the risk-weights for Other Corporates.

**Table A: Bank XYZ's Internal Rating System for
Corporate, Sovereign and Bank Exposures – SME Corporates**
(M = 2.5 years ; obligor's reported annual revenue = HK\$50 Mn)

Grade	Non-defaulted (P) / Defaulted (D)	PD	IRB Risk-Weight (RW)			
			LGD: 75%	LGD:45%	LGD:40%	LGD:35%
1	P	0.03%	18.81%	11.30%	10.03%	8.78%
2	P	0.25%	65.01%	39.01%	34.67%	30.34%
3	P	0.75%	108.57%	65.14%	57.90%	50.67%
4	P	1.50%	136.85%	82.11%	72.99%	63.87%
5	P	3.00%	162.63%	97.58%	86.74%	75.90%
6	P	6.00%	199.14%	119.48%	106.21%	92.93%
7	P	20.00%	314.03%	188.42%	167.48%	146.55%
8	D	100.00%	-	-	-	-

**Table B: Bank XYZ's Internal Rating System for
Corporate, Sovereign and Bank Exposures – Other Corporates**
(M = 2.5 years)

Grade	Non-defaulted (P) / Defaulted (D)	PD	IRB Risk-Weight (RW)			
			LGD: 75%	LGD:45%	LGD:40%	LGD:35%
1	P	0.03%	24.05%	14.44%	12.83%	11.22%
2	P	0.25%	82.45%	49.47%	43.97%	38.48%
3	P	0.75%	137.96%	82.78%	73.58%	64.38%
4	P	1.50%	175.99%	105.59%	93.86%	82.13%
5	P	3.00%	214.07%	128.44%	114.17%	99.90%
6	P	6.00%	266.02%	159.61%	141.88%	124.14%
7	P	20.00%	397.05%	238.23%	211.76%	185.29%
8	D	100.00%	-	-	-	-

(i) **Example 1 (Corporate exposure with on-balance sheet netting)**

Corporate A, classified as grade 5 under the Bank XYZ's internal rating system, borrowed a senior (i.e. not subordinated) loan of HK\$100 Mn from Bank XYZ. Corporate A has also placed a pledged deposit of HK\$10 Mn with Bank XYZ. Both the loan and the pledged deposit are subject to a valid bilateral netting agreement.

Given:

- Corporate A's group total annual revenue = HK\$500 Mn or more
- Specific provision = HK\$1 Mn
- No currency and maturity mismatch between the loan and the pledged deposit

Workings:

- Estimated PD (grade 5) for Corporate A = 3%
- LGD = 45%
- RW = 128.44%
- M = 2.5 years

(a) Exposures *before* recognized guarantees/credit derivative contracts:

(1) On-balance sheet exposures *before* netting = HK\$100 Mn

(2) On-balance sheet exposures *after* netting
= max [0, exposures - liabilities x (1 - H_{fx})]
= HK\$100 Mn - HK\$10 Mn
= HK\$90 Mn

(b) Exposures *after* recognized guarantees/credit derivative contracts (on-balance sheet exposures after netting) = HK\$90 Mn (i.e. EAD)

(c) Risk-weighted amount of the exposure to Corporate A
= EAD x RW
= HK\$90 Mn x 1.2844
= HK\$115.596 Mn

(d) EL-eligible provisions calculation:

(1) EL amount
= EAD x PD x LGD
= HK\$90 Mn x 0.03 x 0.45
= HK\$1.215 Mn
(2) Eligible provisions = HK\$1 Mn

(ii) **Example 2 (SME corporate exposure partially guaranteed by a bank)**

Corporate B, classified as grade 5 under the Bank XYZ's internal rating system, borrowed a subordinated loan of HK\$100 Mn from Bank XYZ. HK\$40 Mn of this

exposure is guaranteed by Bank C, classified as grade 2 under the Bank XYZ's internal rating system. The guaranteed commitment is a senior claim on Bank C.

Given:

- Corporate B's group total annual revenue = HK\$50 Mn or below
- Specific provision = HK\$1.72 Mn
- No currency and maturity mismatch between the transaction and the guarantee
- PD substitution (i.e. not subject to double default framework)

Workings:

Corporate B:

- Estimated PD (grade 5) for Corporate B = 3%
- LGD of the uncovered portion = 75%
- RW = 162.63%
- M = 2.5 years

(a) Exposures *before recognized* guarantees/credit derivative contracts (on-balance sheet exposures before/after netting) = HK\$100 Mn

(b) Exposures *after* recognized guarantees/credit derivative contracts (on-balance sheet exposures after netting)
= HK\$100 - HK\$40 Mn
= HK\$60 Mn (i.e. EAD)

(c) Risk-weighted amount for the exposure to Corporate B (i.e. portion not covered by the guarantee issued by Bank C)
= EAD x RW
= HK\$60 Mn x 1.6263
= HK\$97.578 Mn

(d) EL-eligible provisions calculation:

(1) EL amount
= EAD x PD x LGD
= HK\$60 Mn x 0.03 x 0.75
= HK\$1.35 Mn

(2) Eligible provisions
= HK\$1.72 Mn x 60/100 (or a risk-weighted basis, such as based on the EL amount i.e. 1.35/(1.35 + 0.045))
= HK\$1.032 Mn

Bank C:

- Estimated PD (grade 2) for Bank C = 0.25%
- LGD of the guaranteed portion = 45%

- $RW = 49.47\%$
 - $M = 2.5$ years
- (e) Exposures *after* recognized guarantees/credit derivative contracts (on-balance sheet exposures after netting) = HK\$40 Mn (i.e. EAD)
- (f) Risk-weighted amount of the exposure to Bank C (i.e. the guaranteed portion)
- $$= EAD \times RW$$
- $$= HK\$40 \text{ Mn} \times 0.4947$$
- $$= \underline{HK\$19.788 \text{ Mn}}$$
- (g) EL-eligible provisions calculation:
- (1) EL amount
- $$= EAD \times PD \times LGD$$
- $$= HK\$40 \text{ Mn} \times 0.0025 \times 0.45$$
- $$= \underline{HK\$0.045 \text{ Mn}}$$
- (2) Eligible provisions
- $$= HK\$1.72 \text{ Mn} \times 40/100 \text{ (or a risk-weighted basis, such as based on the EL amount i.e. } 0.045/(1.35 + 0.045))$$
- $$= \underline{HK\$0.688 \text{ Mn}}$$

(iii) Example 3 (Secured corporate exposure fully guaranteed by a sovereign)

Corporate D, classified as grade 5 under the Bank XYZ's internal rating system, borrowed a senior loan of HK\$100 M from Bank XYZ. The transaction is secured by a BBB rated six-year corporate **bond** of HK\$40 Mn and an other recognized IRB collateral of HK\$50 Mn. Also, the exposure is fully guaranteed by Central Bank E which is classified as grade 4 under the Bank XYZ's internal rating system.

Given:

- Corporate D's group total annual revenue = HK\$500 Mn or more
- Haircut for the BBB rated six-year corporate bond (i.e. credit quality grade 3 of residual maturity >5 years) = 12%
- No currency and maturity mismatch between the transaction and the collateral/guarantee
- No specific provisions made

Workings:

Corporate D:

- Estimated PD (grade 5) for Corporate D = 3%
- $M = 2.5$ years

- (a) Exposures before recognized guarantees/credit derivative contracts (on-balance sheet exposures before/after netting) = HK\$100 Mn
- (b) Exposures after recognized guarantees/credit derivatives (on-balance sheet exposures after netting)
 = HK\$100 Mn - HK\$100 Mn
 = HK\$0 Mn
- (c) Eligible provisions = HK\$0 Mn

Sovereign E:

- Estimated PD (grade 4) for Sovereign E = 1.5%
 - M = 2.5 years
- (d) Exposures after recognized guarantees/credit derivative contracts (on-balance sheet exposures after netting) = HK\$100 Mn (i.e. EAD)
- (e) Allocation of EAD according to collateral type:
- (1) Portion fully secured by recognized financial collateral:

$$= C \times (1 - H_c - H_{fx})$$

$$= \text{HK\$40 Mn} \times (1 - 0.12 - 0)$$

$$= \underline{\text{HK\$35.2 Mn}} \text{ (LGD} = 0\%)$$
 - (2) Portion fully secured by other recognized IRB collateral:
 - *Value of the physical collateral*⁵¹:

$$= C \times (1 - H_c - H_{fx})$$

$$= \text{HK\$50 Mn} \times (1 - 0 - 0)$$

$$= \text{HK\$50 Mn}$$
 - *Ratio of the value of the other recognized IRB collateral to the reduced exposure (after recognizing the effect of recognized financial collateral):*

$$= [\text{HK\$50 Mn} / (\text{HK\$100 Mn} - \text{HK\$35.2 Mn})] \times 100\%$$

$$= 77\% \text{ (between } C^* \text{ of } 30\% \text{ and } C^{**} \text{ of } 140\%)$$
 - *Portion fully secured by other recognized IRB collateral:*

$$= \text{Value of the other recognized IRB collateral} / C^{**}$$

$$= \text{HK\$50 Mn} / 140\%$$

$$= \underline{\text{HK\$35.714 Mn}} \text{ (LGD} = 40\%, \text{ RW} = 93.86\%)$$
 - (3) Unsecured portion:

$$= \text{HK\$100 Mn} - \text{HK\$35.2 Mn} - \text{HK\$35.714 Mn}$$

$$= \underline{\text{HK\$29.086 Mn}} \text{ (LGD} = 45\%, \text{ RW} = 105.59\%)$$
- (f) Exposure weighted average LGD

$$= (E_{\text{financial}} \times 0\% + E_{\text{other}} \times 40\% + E_{\text{unsecured}} \times 45\%) / E$$

⁵¹ Haircut (H_c) for eligible IRB collateral is 0%.

$$= (\text{HK\$}35.2 \text{ Mn} \times 0\%) + (\text{HK\$}35.714 \text{ Mn} \times 40\%) + (\text{HK\$}29.086 \text{ Mn} \times 45\%) / \text{HK\$}100 \text{ Mn}$$

$$= \underline{27.37\%}$$

(g) Risk-weighted amount of the exposure to Central Bank E

$$= (\text{EAD} \times \text{RW})_{\text{financial}} + (\text{EAD} \times \text{RW})_{\text{other}} + (\text{EAD} \times \text{RW})_{\text{unsecured}}$$

$$= (\text{HK\$}35.2 \text{ Mn} \times 0) + (\text{HK\$}35.714 \text{ Mn} \times 0.9386) + (\text{HK\$}29.086 \text{ Mn} \times 1.0559)$$

$$= \underline{\text{HK\$}64.233 \text{ Mn}}$$

(h) EL-eligible provisions calculation:

(1) EL amount

$$= (\text{EAD} \times \text{PD} \times \text{LGD})_{\text{financial}} + (\text{EAD} \times \text{PD} \times \text{LGD})_{\text{other}} + (\text{EAD} \times \text{PD} \times \text{LGD})_{\text{unsecured}} \text{ (or } = \text{EAD} \times \text{PD} \times \text{Exposure weighted average LGD)}$$

$$= (\text{HK\$}35.2 \text{ Mn} \times 0.015 \times 0) + (\text{HK\$}35.714 \text{ Mn} \times 0.015 \times 0.4) + (\text{HK\$}29.086 \text{ Mn} \times 0.015 \times 0.45) \text{ or } (= \text{HK\$}100 \text{ Mn} \times 0.015 \times 0.2737)$$

$$= \underline{\text{HK\$}0.411 \text{ Mn}}$$

(2) Eligible provisions = HK\$0 Mn

(iv) Example 4 (Clean Corporate exposure in defaulted grade)

Corporate F, classified as grade 8 (i.e. default) under the Bank XYZ's internal rating system, borrowed a senior unsecured loan of HK\$100 Mn from Bank XYZ.

Given:

- Specific provisions = HK\$40 Mn
- Best estimate of EL = 40%

Workings:

- Estimated PD (grade 8) for Corporate F = 100%
- LGD = 45%

(a) Exposures *before/after recognized* guarantees/credit derivative contracts (on-balance sheet exposures before/after netting) = HK\$100 Mn (i.e. EAD)

(b) Risk-weighted amount of the exposure to Corporate F

$$= \max [0, \text{LGD} - \text{EL}] \times 12.5 \times \text{EAD}$$

$$= (45\% - 40\%) \times 12.5 \times \text{HK\$}100 \text{ Mn}$$

$$= \underline{\text{HK\$}62.5 \text{ Mn}}$$

(c) EL-eligible provisions calculation:

(1) EL amount

$$= \text{EL} \times \text{EAD}$$

$$= 0.4 \times \text{HK\$}100 \text{ Mn}$$

$$= \underline{\text{HK\$}40 \text{ Mn}}$$

(2) Eligible provisions = HK\$40 Mn

(B) Equity Exposures

(v) Example 5 (Market-based approach: Internal models method)

Bank XYZ has an equity holding in Company G, which is traded on a **recognized stock exchange** and does not fall within paragraph 119 or 120 of the instructions. The fair value of the equity holding is HK\$20 Mn. Any change in its fair value will be flowing directly through income and into **regulatory capital**. The potential loss on the equity holding as derived by using internal VaR model is HK\$4 Mn.

Given:

- No specific provision made

Workings:

(a) Exposures *before/after netting* = HK\$20 Mn

(b) Risk-weighted amount of equity exposure to Company G:

(1) Minimum risk-weighted amount (using the simple risk weight)

= EAD x RW

= HK\$20 Mn x 200%

= HK\$40 Mn

(2) Risk-weighted amount under internal VaR model

= Potential loss x 12.5

= HK\$4 Mn x 12.5

= HK\$50 Mn

Risk-weighted amount = max [(1), (2)] = HK\$50 Mn

(c) Eligible provisions = HK\$0 Mn

(C) Retail Exposures

(vi) Example 6 (QRRE)

Within the exposure subclass of QRRE, Bank XYZ is using a separate internal rating system for revolving personal loans with PD estimates as given below. There are four defaulted pools with LGD estimates of 30%, 60%, 85% and 100%.

Table C: Bank XYZ's Internal Rating System for QRRE

Pool	Non-defaulted (P) / Defaulted (D)	PD	IRB Risk Weight (RW)		
			LGD: 85%	LGD:60%	LGD:30%
1	P	0.05%	2.86%	2.02%	1.01%
2	P	0.25%	10.88%	7.68%	3.84%

Pool	Non-defaulted (P) / Defaulted (D)	PD	IRB Risk Weight (RW)		
			LGD: 85%	LGD:60%	LGD:30%
3	P	0.75%	26.06%	18.40%	9.20%
4	P	3.00%	73.03%	51.55%	25.78%
5	P	6.00%	116.37%	82.14%	41.07%
6	P	15.00%	196.23%	138.51%	69.26%
7	D	100.00%	-	-	-

Bank XYZ has granted an unsecured revolving loan facility of HK\$1 Mn to Mr. H, of which HK\$0.8 Mn has been drawn down and is outstanding. The exposure to Mr. H is classified in the retail pool with a PD estimate of 0.75% (i.e. grade 3) and LGD estimate of 60%.

Given:

- No specific provision made
- The undrawn portion is unconditionally cancellable with a CCF of 0%
- Estimated PD (grade 3) for Mr. H = 0.75%
- LGD = 60%
- RW = 18.40%

Workings:

(a) Exposures *before/after recognized* guarantees/credit derivative contracts:

- (1) On-balance sheet exposures before/after netting = HK\$0.8 Mn
- (2) Off-balance sheet exposures (Other than OTC derivative transactions, credit derivative contracts and SFTs)
 = Principal amount x CCF
 = (HK\$1 Mn - HK\$0.8 Mn) x 0%
 = HK\$0 Mn

(b) Risk-weighted amount of the exposure to Mr. H:

$$\begin{aligned}
 &= \text{EAD} \times \text{RW} \\
 &= \text{HK\$0.8 Mn} \times 0.184 \\
 &= \text{HK\$0.147 Mn}
 \end{aligned}$$

(c) EL-eligible provisions calculation:

- (1) EL amount
 = EAD x PD x LGD
 = HK\$0.8 Mn x 0.0075 x 0.6
 = HK\$0.004 Mn
- (2) Eligible provisions = HK\$0 Mn

Annex IIIc-B: Structure of the IRB Return [MA(BS)3(IIIc)]

Division	Template	IRB Class/Subclass To Be Reported
A.	IRB_TOTCRWA	For all IRB classes/subclasses under IRB approach
B.	IRB_CSB	<p>For each of the following IRB subclasses for corporate/sovereign/bank exposures under FIRB approach or AIRB approach :-</p> <ul style="list-style-type: none"> • <u>Corporate exposures</u>: (i) Small-and-medium sized corporates • <u>Corporate exposures</u>: (ii) Other corporates • <u>Corporate exposures</u>: (iii) Specialized Lending (high-volatility commercial real estate) • <u>Sovereign exposures</u>: (i) Sovereigns • <u>Sovereign exposures</u>: (ii) Sovereign foreign public sector entities • <u>Sovereign exposures</u>: (iii) Multilateral development banks • <u>Bank exposures</u>: (i) Banks • <u>Bank exposures</u>: (ii) Securities firms • <u>Bank exposures</u>: (iii) Public sector entities (excluding sovereign foreign public sector entities)
	IRB_SLSLOT	<p>For each of the following IRB subclasses where supervisory slotting criteria approach is applicable:-</p> <ul style="list-style-type: none"> • <u>Corporate exposures</u>: (i) Specialized Lending under supervisory slotting criteria approach (project finance) • <u>Corporate exposures</u>: (ii) Specialized Lending under supervisory slotting criteria approach (object finance) • <u>Corporate exposures</u>: (iii) Specialized Lending under supervisory slotting criteria approach (commodities finance) • <u>Corporate exposures</u>: (iv) Specialized Lending under supervisory slotting criteria approach (income-producing real estate) • <u>Corporate exposures</u>: (v) Specialized Lending (high-volatility commercial real estate)
	IRB_RETAIL	<p>For each of the following IRB subclasses for retail exposures under retail IRB approach:-</p> <ul style="list-style-type: none"> • <u>Retail exposures</u>: (i) Residential mortgages to individuals • <u>Retail exposures</u>: (ii) Residential mortgages to property-holding shell companies • <u>Retail exposures</u>: (iii) Qualifying revolving retail exposures • <u>Retail exposures</u>: (iv) Small business retail exposures • <u>Retail exposures</u>: (v) Other retail exposures to individuals
	IRB_EQUSRW	<u>Equity exposures</u> : Market-based approach: Simple risk-weight method
	IRB_EQUINT	<u>Equity exposures</u> : Market-based approach: Internal models method

Division	Template	IRB Class/Subclass To Be Reported
	IRB_EQUPDLGD	For each of the following IRB subclasses for equity exposures under PD/LGD approach:- <ul style="list-style-type: none"> • <u>Equity exposures</u>: (i) Publicly traded equity exposures held for long-term investment • <u>Equity exposures</u>: (ii) Privately owned equity exposures held for long-term investment • <u>Equity exposures</u>: (iii) Other publicly traded equity exposures • <u>Equity exposures</u>: (iv) Other equity exposures
	IRB_EQUO	<u>Equity exposures</u> : Market-based approach or PD/LGD Approach: Exposures not reported in Forms IRB_EQUSRW, IRB_EQUINT and IRB_EQUPDLGD
	IRB_OTHER	For cash items and other items under specific risk-weight approach
C.	IRB_FIRBLGD	For each of the IRB subclasses for corporate/sovereign/bank exposures reported under FIRB approach in Division B
	IRB_AIRBLGD	For each of the IRB subclasses for corporate/sovereign/bank exposures reported under AIRB approach in Division B
D.	IRB_OBSND	For the IRB classes of corporate/sovereign/bank/retail exposures under IRB approach
E.	IRB_OBSD_N_IMM	For the IRB classes of corporate/sovereign/bank/retail exposures under IRB approach: Default risk exposures not under IMM(CCR) approach
	IRB_OBSD_IMM	For the IRB classes of corporate/sovereign/bank/retail exposures under IRB approach: Default risk exposures under IMM(CCR) approach
F.	IRB_ELEP	For the IRB classes of corporate/sovereign/bank/retail exposures under IRB approach

Annex IIIc-C: Illustrative Risk-weights under IRB Approach

IRB Class / Subclass	Corporate Exposures		Residential Mortgages		Small Business Retail Exposures and Other Retail Exposures to Individuals		Qualifying Revolving Retail Exposures	
LGD:	45%	45%	45%	25%	45%	85%	45%	85%
Maturity 2.5 years								
Annual revenue (HK\$ Mn)	500	50

15.00%	221.54%	171.91%	235.72%	130.96%	88.60%	167.36%	103.89%	196.23%
20.00%	238.23%	188.42%	253.12%	140.62%	100.28%	189.41%	117.99%	222.86%

Note:

1. The above table provides illustrative risk-weights for UL calculated for the IRB class of corporate exposures and the IRB subclasses of retail exposures under the IRB approach. Each set of risk-weights is produced using the appropriate risk-weight functions. The inputs used to calculate the illustrative risk weights include measures of PD and LGD and an assumed M of 2.5 years.
2. A firm-size adjustment applies to exposures falling within the IRB subclass of small-and-medium sized corporates (defined as exposures to a corporate where the reported total annual revenue for the consolidated group of which the corporate is a part is less than HK\$500 million). Accordingly, the firm-size adjustment is made in determining the second set of risk-weights provided in the second column of corporate exposures given that the annual revenue of the corporate receiving the exposure is assumed to be HK\$50 million.

Completion Instructions

Return of Capital Adequacy Ratio Part IIIId – Risk-weighted Amount for Credit Risk (Securitization Exposures) Form MA(BS)3(IIIId)

Introduction

1. Form MA(BS)3(IIIId) of Part III should be completed by each authorized institution incorporated in Hong Kong that has *securitization exposures*¹ booked in its *banking book*.
2. This Form contains the following Divisions:
 - (a) Division A is a summary table showing the total *risk-weighted amounts* (“RWAs”) of the securitization exposures of a reporting institution (“reporting AI”) and the capital deduction required in respect of its *securitization transactions* or securitization exposures.
 - (b) Division B captures securitization exposures (other than *re-securitization exposures*) that are subject to the *securitization internal ratings-based approach (SEC-IRBA)*;
 - (c) Division C1 captures securitization exposures (other than re-securitization exposures) that are subject to the *securitization external ratings-based approach (SEC-ERBA)* where the risk-weights are determined based on *long-term ECAI issue specific ratings* or *long-term inferred ratings*;
 - (d) Division C2 captures securitization exposures (other than re-securitization exposures) that are subject to the SEC-ERBA where the risk-weights are determined based on *short-term ECAI issue specific ratings* or *short-term inferred ratings*;
 - (e) Division D1 captures securitization exposures (other than re-securitization exposures) that are subject to the *securitization standardized approach (SEC-SA)*; and
 - (f) Division D2 captures re-securitization exposures that are subject to the SEC-SA; and
 - (g) Division E captures securitization exposures (including re-securitization exposures) that are subject to the *securitization fall-back approach (SEC-FBA)*.

¹ For example, asset-backed securities, mortgage-backed securities, credit enhancements, liquidity facilities, interest rate or currency swaps, credit derivative contracts, tranching credit protection, and reserve accounts, such as cash collateral accounts, recorded as an asset by the originating institution.

3. In each of Divisions B, C1, C2, D1, D2 and E, columns (1) to (3) are for reporting of on-balance sheet securitization exposures while columns (4) to (7) are for reporting of off-balance sheet securitization exposures.
4. This Form and its completion instructions should be read in conjunction with the Banking (Capital) Rules (“BCR”) and the relevant supervisory policy and guidance (in particular, the SPM module CR-G-12 “Credit Risk Transfer Activities” and the Q&As on the securitization framework).

General Instructions

A. Definitions of terms referred to in the Form

5. “Principal Amount” of an off-balance sheet exposure has the same meaning as that given by paragraph (b) of the definition of *principal amount* in section 227(1) of the BCR. However, if the off-balance sheet exposure concerned is a default risk exposure arising from a derivative contract, “Principal Amount” means the notional amount of the contract.
6. “Exposure Amount before CRM”
 - (a) In Division B of the Form—means the *exposure amount* of a securitization exposure before taking into account any *Part 7 credit risk mitigation* (“Part 7 CRM”) obtained for the exposure, but net of any amounts that are permitted to be deducted from the exposure amount (e.g. specific provisions, write-offs and non-refundable purchase price discounts) under section 236(3) of the BCR;
 - (b) In Divisions C1 to E of the Form—
 - (i) if the securitization exposure is an on-balance sheet exposure, a default risk exposure or an exposure arising from the provision of unfunded credit protection—means the exposure amount of the exposure before taking into account any Part 7 CRM obtained for the exposure, but net of any amounts that are permitted to be deducted from the exposure amount (e.g. specific provisions, write-offs and non-refundable purchase price discounts) under section 236(3) of the BCR;
 - (ii) in any other case—means the amount obtained by multiplying the principal amount of the exposure (net of the amounts specified in section 236(3) of the BCR, if any) by the factor applicable to the exposure specified in section 235(2)(c) of the BCR;
7. “Senior exposures” means securitization exposures in *senior tranches* (See **Annex IIIId-A** for more information on the determination of seniority).
8. “Non-senior exposures” means securitization exposures in *non-senior tranches*.
9. “Senior long-term exposures” means senior exposures that have a long-term ECAI issue specific rating or a long-term inferred rating.

10. “Non-senior long-term exposures” means non-senior exposures that have a long-term ECAI issue specific rating or a long-term inferred rating.
11. “Senior short-term exposures” means senior exposures that have a short-term ECAI issue specific rating or a short-term inferred rating.
12. “Non-senior short-term exposures” means non-senior exposures that have a short-term ECAI issue specific rating or a short-term inferred rating.
13. “Risk-weight” means—
 - (a) in the case of a securitization exposure (other than a re-securitization exposure)—the risk-weight applicable to the exposure determined by using the SEC-IRBA, SEC-ERBA, SEC-SA or SEC-FBA—
 - (i) after taking into account the risk-weight floor of 15% and, if applicable, the risk-weight cap for senior tranches (see sections 240 and 241 of the BCR); and
 - (ii) without taking into account any Part 7 CRM.
 - (b) in the case of a re-securitization exposure—the risk-weight applicable to the exposure determined by using the SEC-SA or SEC-FBA—
 - (i) after taking into the risk-weight floor of 100% (see section 240 of the BCR); and
 - (ii) without taking into account any Part 7 CRM;
 - (c) in the case of Part 7 CRM obtained for a securitization exposure— the risk-weight applicable to—
 - (i) the *recognized collateral* determined in accordance with Part 4, 6 or 7 and in compliance with Division 5 of Part 7 of the BCR; or
 - (ii) the *credit protection provider* of the *recognized guarantee* or *recognized credit derivative contract*, as the case may be, determined in accordance with Part 4 or 6 and in compliance with Division 5 of Part 7 of the BCR.

B. **Reporting of underlying exposures of securitization transaction where reporting AI is originating institution**

14. The AI must report the *underlying exposures* of a *non-eligible securitization transaction* as follows—
 - (a) report the exposures in Form MA(BS)3(IIIa), Form MA(BS)3(IIIb) or Form MA(BS)3(IIIc) (if the exposures are non-securitization exposures) or this Form (if the exposures are securitization exposures), as if the exposures had not been securitized; and

- (b) if the transaction is a ***synthetic securitization transaction***, the exposures must be reported without taking into account the effect of any credit risk mitigation (“CRM”) used for transferring the credit risk of the underlying exposures to other parties to the transaction.
15. If the transaction is ***an eligible securitization transaction*** and the AI has served a notice to the HKMA for applying the treatments set out in section 230(3) of the BCR to the underlying exposures—
- (a) (in the case of a ***traditional securitization transaction***) the AI is not required to report the underlying exposures in any of Form MA(BS)3(IIIa), Form MA(BS)3(IIIb), Form MA(BS)3(IIIc) and this Form;
 - (b) (in the case of a synthetic securitization transaction) the AI must report the underlying exposures and the effect of the CRM used for transferring the credit risk of the exposures in Form MA(BS)3(IIIa), Form MA(BS)3(IIIb) or Form MA(BS)3(IIIc) (if the exposures are non-securitization exposures) or this Form (if the exposures are securitization exposures).

C. Decomposition of exposures covered by tranching credit protection

16. Subject to paragraph 17, if a securitization exposure or non-securitization exposure is covered by ***tranching credit protection*** (“protected exposure”), no matter whether the protection is provided or obtained by the reporting AI, the protected exposure must be decomposed² into a protected sub-tranche and an unprotected sub-tranche. The sub-tranches resulted from decomposing a non-securitization exposure must be treated as securitization exposures for the purposes of calculating their RWAs.
17. When decomposing an exposure for which the AI has obtained tranching credit protection, the decomposition must take into account—
- (a) if there is a ***maturity mismatch***—the adjustment to the value of the credit protection required under section 246 of the BCR; and
 - (b) if the tranching credit protection is in the form of recognized collateral and the reporting AI uses the ***comprehensive approach*** or Formula 19 in Part 6 of the BCR to take into account the credit risk mitigation effect of the collateral—the adjustment to the value of the credit protection resulted from any applicable ***standard supervisory haircuts*** applied to the collateral.

D. Reporting of derivative contracts entered into under securitization transactions

18. If a reporting AI’s securitization exposure is a ***default risk exposure*** arising from a ***derivative contract*** and the risk-weight of the exposure is determined by

² The sub-tranches resulted from the decomposition are not considered as re-securitization exposures for capital adequacy purposes.

using the SEC-IRBA, SEC-ERBA, SEC-SA or SEC-FBA, the default risk exposure must be reported in this Form.

E. **Treatment of default risk and dilution risk in respect of purchased receivables under SEC-IRBA**

19. For cases where the default and dilution risks are not treated in an aggregated manner, the reporting AI must determine in a prudent manner how the K_{IRB} of the entire pool of the underlying exposures concerned should be calculated in order to adequately reflect the extent to which the AI is exposed to the two risks (see section 252(3) of the BCR). Reporting AIs may refer to Section B of Annex 1 to the paper “Revisions to the securitisation framework” issued by the Basel Committee on Banking Supervision in December 2014 (revised in July 2016) for guidance.

Specific Instructions

F. **Reporting requirements for Division A**

20. Column (1) is for reporting the total RWAs of all of a reporting AI’s securitization exposures to securitization transactions and the capital deductions required in respect of securitization transactions. If the reporting AI is the originating institution of any of these securitization transactions, it should report the RWAs of its securitization exposures to, and the capital deductions in respect of, the transactions originated by it in Column (2) as a sub-set of the amounts reported in Column (1).
21. Items A5 (a) and (b) are to be filled in by reporting AIs that are originating institutions. If a reporting AI, which is the originating institution of a securitization transaction (other than a re-securitization transaction), has, in accordance with section 242 of the BCR, taken the maximum capital charge calculated for the transaction under that section as the total capital charge of all the AI’s securitization exposures to the transaction, the AI—
- (a) must report the corresponding RWA (i.e. the maximum capital charge times 12.5) in either item A5 (a) or (b) based on the original approach used by the AI for risk-weighting the securitization exposures; and
 - (b) must not adjust the RWAs of the securitization exposures reported in any of Divisions B to E to reconcile with the amount reported in items A5 (a) or (b) (in other words, the amounts reported in any of these Divisions must be based on risk-weights without considering the maximum capital charge).

G. **Reporting requirements for Divisions B to E – Securitization Exposures not covered by Part 7 CRM**

22. Subject to paragraph 24, if a reporting AI has not obtained any Part 7 CRM for any of its securitization exposure—

- (a) the exposure amount before CRM of the exposure must be reported in column (1) or (5), as the case requires;
 - (b) if the exposure is an off-balance sheet exposure, its principal amount must be reported in column (4);
 - (c) the exposure amount after CRM of the exposure, which is the same amount as the exposure amount before CRM, must be reported in column (2) or (6), as the case requires;
 - (d) the RWA of the exposure, which is the product of the amount reported in column (2) or (6) and the risk-weight of the exposure, must be reported in column (3) or (7), as the case requires; and
 - (e) all the amounts above must be reported in the same row that corresponds to the risk-weight applicable to the exposure.
23. The reporting arrangements in paragraph 22 also apply to cases where the securitization exposure is a default risk exposure calculated by using the ***IMM(CCR) approach*** where the recognized collateral obtained by the reporting AI has already been included in the calculation of the default risk exposure under the IMM(CCR) approach.
24. Securitization exposures arising from credit protection provided by reporting AI
- (a) If full or proportional credit protection is provided by the AI to securitization exposure (“protected exposure”)—
 - (i) for the purpose of paragraphs 22(a) and 22(b), the AI must determine the amount to be reported in column (1) or the amounts to be reported in columns (4) and (5), as the case requires, as if it directly held that portion of the protected exposure on which it has provided the credit protection; and
 - (ii) for the purpose of paragraph 22(e), the risk-weight applicable to the AI’s exposure is the risk-weight applicable to the protected exposure.
 - (b) If tranching credit protection is provided by the AI to a securitization or non-securitization exposure—
 - (i) for the purpose of paragraphs 22(a) and 22(b), the AI must report the amount of the protected sub-tranche in column (1) or in columns (4) and (5); and
 - (ii) for the purpose of paragraph 22(e), the risk-weight applicable to the AI’s exposure is the risk-weight applicable to the protected sub-tranche determined under section 249 of the BCR.

H. **Reporting requirements for Division B - Securitization Exposures covered by Full or Proportional Credit Protection**

25. If Part 7 CRM is obtained by a reporting AI for any of its securitization exposure and the exposure is risk-weighted by using the SEC-IRBA, the AI must report the exposure amount before CRM of the exposure in column (1) or (5), and, if the exposure is an off-balance sheet exposure, the principal amount of the exposure in column (4), and in the row corresponding to the risk-weight applicable to the securitization exposure.
26. If the Part 7 CRM is a recognized guarantee or a recognized credit derivative contract, the AI must, after adjusting the value of the credit protection for any maturity mismatch in accordance with section 246 of the BCR—
- (a) report in the row corresponding to the risk-weight applicable to the securitization exposure and—
 - (i) in column (2) or (6)—the uncovered portion of the exposure determined in accordance with the *substitution framework* under Part 6 of the BCR; and
 - (ii) in column (3) or (7)—the RWA of the uncovered portion; and
 - (b) report in the row corresponding to the risk-weight applicable to the credit protection provider concerned and —
 - (i) in column (2) or (6)—the covered portion of the exposure determined in accordance with the substitution framework; and
 - (ii) in column (3) or (7)—the RWA of the covered portion.
27. If the Part 7 CRM is recognized collateral, the AI must report—
- (a) the net credit exposure (after adjusting the value of the credit protection for any maturity mismatch in accordance with section 246 of the BCR) determined by using Formula 19 in Part 6 of the BCR in column (2) or (6); and
 - (b) the RWA of the net credit exposure in column (3) or (7).

All the amounts above must be reported in the same row corresponding to the risk-weight applicable to the securitization exposure.

I. **Reporting requirements for Divisions C1 to E - Securitization Exposures covered by Full or Proportional Credit Protection**

28. If Part 7 CRM is obtained by a reporting AI for any of its securitization exposure and the exposure is risk-weighted by using the SEC-ERBA, SEC-SA or SEC-FBA, the AI must report the exposure amount before CRM of the exposure in column (1) or (5), and, if the exposure is an off-balance sheet exposure, the principal amount of the exposure in column (4), and in the row corresponding to the risk-weight applicable to the exposure.

29. Reporting arrangements applicable to recognized collateral subject to the *simple approach*, recognized guarantees, recognized credit derivative contracts
- (a) If the securitization exposure is an on-balance sheet exposure, a default risk exposure or an exposure arising from the provision of unfunded credit protection, the AI must, after adjusting the value of the credit protection for any maturity mismatch in accordance with section 246 of the BCR—
- (i) report the ***credit protection uncovered portion*** of the exposure in column (2) or (6) and in the row corresponding to the risk-weight applicable to the securitization exposure;
- (ii) report the ***credit protection covered portion*** of the exposure in column (2) or (6) and in the row corresponding to the risk-weight applicable to the credit protection provider or the collateral concerned; and
- (iii) report—
- the RWA of the credit protection uncovered portion in column (3) or (7) and in the row corresponding to the risk-weight applicable to the securitization exposure; and
 - the RWA of the credit protection covered portion in column (3) or (7) and in the row corresponding to the risk-weight applicable to the credit protection provider or collateral concerned.
- (b) If the securitization exposure is an off-balance sheet exposure other than one that is captured in paragraph (a), the same reporting arrangements in paragraph (a) apply except that—
- (i) the references to “credit protection uncovered portion” in paragraphs (a)(i) and (a)(iii) must be construed to mean the product of the credit protection uncovered portion of the exposure and the factor applicable to the exposure specified in section 235(2)(c); and
- (ii) the references to “credit protection covered portion” in paragraphs (a)(ii) and (a)(iii) must be construed to mean the product of the credit protection covered portion of the exposure and the factor applicable to the exposure specified in section 235(2)(c).
30. Reporting arrangements applicable to recognized collateral subject to the *comprehensive approach*
- (a) The net credit exposure (after adjusting the value of the credit protection for any maturity mismatch in accordance with section 246 of the BCR) calculated under section 87, 88 or 89 of the BCR, as the case requires, must be reported in column (2) or (6); and
- (b) the RWA of the net credit exposure must be reported in column (3) or (7).

All the amounts above must be reported in the same row corresponding to the risk-weight applicable to the securitization exposure.

J. Reporting requirements for Divisions B to E - Securitization Exposure or Non-securitization Exposure covered by Tranched Credit Protection

31. If the tranched credit protection is obtained by a reporting AI for a securitization exposure or non-securitization exposure, the AI must report—
- (a) the amounts of the unprotected sub-tranche and protected sub-tranche in column (1) or in columns (4) and (5), and in the rows corresponding to the risk-weights applicable to the sub-tranches (i.e. the risk-weights determined in accordance with section 249 of the BCR);
 - (b) the amount of the unprotected sub-tranche in column (2) or (6) and in the row corresponding to the risk-weight applicable to the unprotected sub-tranche;
 - (c) the amount of the protected sub-tranche in column (2) or (6) and in the row corresponding to the risk-weight applicable to the collateral or the credit protection provider concerned, as the case may be;
 - (d) the RWA of the unprotected sub-tranche in column (3) or (7) and in the row corresponding to the risk-weight applicable to the unprotected sub-tranche; and
 - (e) the RWA of the protected sub-tranche in column (3) or (7) and in the row corresponding to the risk-weight applicable to the collateral (if the simple approach is used) or credit protection provider.

K. Reporting of overlapping securitization exposures

32. If there is an overlapping portion in a reporting AI's securitization exposures to a securitization transaction and the overlapping is between securitization exposures booked in the banking book and the trading book of the AI, the overlapping portion that is attributed to the exposures booked in the banking book must be reported in this Form. However, if the overlapping portion is attributed to the exposures booked in the trading book, the overlapping portion must be reported in Form MA(BS)3(IV) (see **Annex IIIId-B** for illustration).

Hong Kong Monetary Authority

March 2018

Guidance on determining the seniority of tranches

1. If several senior tranches in the same securitization transaction have different maturities and the tranches share pro rata loss allocation, the different maturities shall have no effect on the seniority of these tranches since they benefit from the same level of credit enhancement.
2. In a typical synthetic securitization transaction, a tranche that does not have an ECAI issue specific rating (“relevant tranche”) would be treated as a senior tranche, provided that an *inferred rating* can be attributed to the relevant tranche by reference to a *rated* lower tranche that is a senior tranche.
3. In a traditional securitization transaction where all tranches above the *first loss tranche* are rated, the most highly rated position would be treated as a senior tranche. If there are several tranches that share the same rating, only the tranche that is eligible for the highest priority of payment or repayment will be treated as a senior tranche. If there are several senior tranches having different ratings and the different ratings only result from a difference in maturity, all of these tranches should be treated as a senior tranche.
4. A *liquidity facility* supporting an *ABCP programme* may be treated as a senior tranche if—
 - (a) the facility is sized to cover all of the outstanding commercial papers and other senior debts supported by the pool of underlying exposures concerned; and
 - (b) no cash flows from the pool of underlying exposures can be transferred to creditors (other than the person providing the facility) until the drawn portion of the liquidity facility is repaid in full.
5. If a liquidity facility supporting an ABCP programme does not meet the conditions in paragraphs 4(a) and 4(b), or if for other reasons the facility constitutes a mezzanine position in economic substance rather than a senior position in the pool of underlying exposures concerned, the facility should be treated as a non-senior tranche.

Treatment of Overlapping Securitization Exposures

1. A reporting AI may determine the amount of the overlapping portion using any of the two different approaches described below.
2. The first approach is to split its securitization exposures to a securitization transaction into—
 - (a) portions that overlap with another securitization exposure held by it to the same transaction; and
 - (b) other portions that do not overlap with each other.
3. The second approach is to expand its securitization exposures to a securitization transaction by assuming for capital adequacy purposes that the institution's obligations with respect to one of the securitization exposures are larger than those established contractually. This could be done, say, by expanding the trigger events to exercise a facility and/or the extent of the institution's obligations under the facility. For example, if a liquidity facility provided by an authorized institution to an ABCP programme is not contractually required to cover defaulted assets or will not fund the programme under certain circumstances, the institution may regard the facility overlaps with the commercial papers ("CPs") issued by the ABCP conduit held by the institution as if—
 - (a) its obligations under the facility covered the defaulted assets; or
 - (b) the circumstances concerned were trigger events which, if occur, will allow the facility to be drawn,

such that the facility would preclude all losses on the CPs. In this case, the institution is not required to hold regulatory capital for the CPs. However, the regulatory capital it must hold against the facility must be calculated based on the obligations as expanded in the manner described in paragraph (a) and (b) instead of those established contractually.

Illustrative Examples of the First Approach

4. An originating institution of an ABCP programme provides a liquidity facility of \$10 million to the programme. The institution also holds \$2 million of the CPs (rating: A-2) issued under the programme. The overlapping portion of these two exposures is \$2 million and the liquidity facility has a higher seniority than the CPs. Other details are as follows:

- (a) the risk-weight of the liquidity facility (RW_{facility}) is 15%;
- (b) the CCF applicable to the liquidity facility is 100%;
- (c) the risk-weight of the CPs is 50% (RW_{credit});
- (d) the market risk capital charge factor for specific risk of the CPs under the STM approach is 4% which is equivalent to a risk-weight of 50% (RW_{market}).

A. Overlapping within Banking Book (i.e. liquidity facility overlaps with CPs that are held in the banking book)

5. Since the liquidity facility has a higher seniority, fulfilling the AI's obligations with respect to the CPs by absorbing credit losses on the underlying exposures first will preclude a loss from the facility, the overlapping portion is attributed to the CPs.

(a) The RWA of the overlapping portion:

$$= 2 \text{ million} \times RW_{\text{credit}}$$

$$= 2 \text{ million} \times 50\%$$

$$= 1 \text{ million} \text{ --- (1)}$$

(b) The RWA of the portion of the liquidity facility that is not the overlapping portion:

$$= (10 \text{ million} - 2 \text{ million}) \times CCF \times RW_{\text{liquidity}}$$

$$= 8 \text{ million} \times 100\% \times 15\%$$

$$= 1.2 \text{ million} \text{ --- (2)}$$

6. The total RWA of the institution's securitization exposures to the programme:

$$= (1) + (2)$$

$$= 1 \text{ million} + 1.2 \text{ million}$$

= 2.2 million

B. Overlapping between Banking Book and Trading Book (i.e. liquidity facility overlaps with CPs that are held in the trading book)

7. If the overlapping portion is attributed to the liquidity facility, RWA of the overlapping portion

$$= 2 \text{ million} \times \text{CCF} \times \text{RW}_{\text{liquidity}}$$

$$= 2 \text{ million} \times 100\% \times 15\%$$

$$= 0.3 \text{ million}$$

8. If the overlapping portion is attributed to the CPs, the RWA of the overlapping portion

$$= 2 \text{ million} \times \text{RW}_{\text{market}}$$

$$= 2 \text{ million} \times 50 \%$$

$$= 1 \text{ million}$$

9. The overlapping portion is attributed to the CPs as this results in a higher RWA. Hence, the RWA of 1 million must be reported in Form MA(BS)3(IV).

10. The RWA of the portion of the liquidity facility that is not the overlapping portion

$$= (10 \text{ million} - 2 \text{ million}) \times \text{CCF} \times \text{RW}_{\text{liquidity}}$$

$$= 8 \text{ million} \times 100\% \times 15\%$$

$$= 1.2 \text{ million} \quad (\text{To be reported in this Form})$$

Completion Instructions

Return of Capital Adequacy Ratio Part IIIe – Risk-weighted Amount for Exposures to Central Counterparties Form MA(BS)3(IIIe)

Introduction

1. Form MA(BS)3(IIIe) of Part III should be completed by all authorized institutions incorporated in Hong Kong regardless of the approach adopted by the institutions for calculating their *credit risk* for *non-securitization exposures*.
2. This Form captures credit exposures to *central counterparties* (CCPs) calculated under Division 4 of Part 6A of the Banking (Capital) Rules (BCR).
3. The Form is divided into two divisions:
 - (a) Division A is for reporting the reporting institution's credit exposures to CCPs arising from *default fund contributions*; and
 - (b) Division B is for reporting the following credit exposures of the reporting institution to CCPs –
 - (i) If the institution is a *clearing member* of a CCP –
 - (A) its *default risk exposures* to the CCP in respect of *derivative contracts* (including exchange traded derivative contracts) and *securities financing transactions* (SFTs) entered into with the CCP for the institution's own purposes;
 - (B) its credit exposures to the CCP arising from collateral posted by it with the CCP where the collateral is held by the CCP in a manner that is not bankruptcy remote from the CCP; and
 - (C) its default risk exposures to the CCP arising from guarantees provided by the institution to its *clients* for any loss due to changes in the value of the clients' transactions in the event that the CCP defaults.
 - (ii) If the institution is a client of a clearing member of a CCP and all of the conditions set out in section 226ZA(6), or all of the conditions set out in section 226ZA(6)(a)(i) and (ii), (b) and (c) of the BCR, as the case requires, are met –
 - (A) its default risk exposures to the clearing member in respect of *CCP-related transactions*;

- (B) its default risk exposures to the CCP in respect of transactions under which the institution's performance is guaranteed by the clearing member; and
 - (C) its credit exposures to the clearing member arising from collateral posted by it and held by the CCP on the institution's behalf in a manner that is not bankruptcy remote.
- 4. The ***risk-weighted amount*** of the following exposures should be determined in accordance with Part 4, 5 or 6 of the BCR and reported in Form MA(BS)3(IIIa), (IIIb) or (IIIc), as the case requires –
 - (a) credit exposures to CCPs arising from delayed or failed settlement of –
 - (i) cash transactions in securities (other than ***repo-style transactions***), foreign exchange or commodities; and
 - (ii) cash-settled derivative contracts;
 - (b) where the reporting institution is a clearing member of a CCP, its default risk exposures to its clients in respect of –
 - (i) CCP-related transactions; and
 - (ii) guarantees provided by the institution to the CCP on the performance of its clients;
 - (c) where the reporting institution is a client of a clearing member of a CCP (regardless of whether the clearing member acts as a financial intermediary or guarantees the institution's transactions with the CCP) and any of the conditions set out in sections 226ZA(6)(a)(i) and (ii), (b) and (c) of the BCR is not met –
 - (i) its default risk exposures to the clearing member in respect of CCP-related transactions and transactions with the CCP guaranteed by the clearing member; and
 - (ii) its credit exposures to the clearing member arising from collateral posted by it and held by the CCP on the institution's behalf in a manner that is not bankruptcy remote; and
 - (d) where the reporting institution has posted collateral with a CCP or a clearing member and the collateral is held by a person other than the CCP in a manner that is not bankruptcy remote, the credit exposures to that person in respect of the collateral.
- 5. The transactions mentioned in paragraphs 4(b) and 4(c)(i) above are also subject to ***CVA capital charge***. Reporting institutions should calculate the CVA capital charge for these transactions in accordance with Division 3 of Part 6A of the BCR and report the amount in Form MA(BS)3(III f).

6. This Form and its completion instructions should be read in conjunction with the BCR and the relevant supervisory policy/guidance related to the revised capital adequacy framework.

General Instructions

7. If a CCP is no longer qualified as a *qualifying CCP* (QCCP), a reporting institution may, unless otherwise instructed by the Monetary Authority, within 3 months from the date the CCP lost its QCCP status, continue to calculate the risk-weighted amounts of its default fund contribution and default risk exposures to the CCP as if the CCP were a QCCP. When the 3-month period expires, the institution should calculate the risk-weighted amounts of its exposures to the CCP in accordance with the requirements applicable to a *non-qualifying CCP* (non-QCCP).
8. “Principal Amount” in Division B –
 - (a) in the case of derivative contracts, means the *notional amount* of the contracts;
 - (b) in the case of SFTs, means the *principal amount* of the securities or money sold or lent, or the money paid or lent, or the securities or money provided as collateral, as the case requires, under the SFTs concerned; and
 - (c) in the case of collateral posted, means the *fair value* of the collateral.
9. “Non-IMM(CCR) Default Risk Exposure” in Division B –
 - (a) in the case of derivative contracts that are not subject to *valid bilateral netting agreements*, means the *credit equivalent amount* of the contracts calculated by using the *current exposure method*;
 - (b) in the case of derivative contracts that are subject to valid bilateral netting agreements, means the net credit exposure mentioned in section 95 or 131, or the *EAD* mentioned in section 209(2), of the BCR calculated by using the current exposure method;
 - (c) in the case of SFTs that are not subject to valid bilateral netting agreements, means the amount reported in the column “Principal Amount” mentioned in paragraph 8(b) above; and
 - (d) in the case of SFTs that are subject to valid bilateral netting agreements, means the net credit exposure calculated under section 96, 97 or 209(3) of the BCR, as the case requires.
10. “IMM(CCR) Default Risk Exposure” in Division B means the default risk exposure calculated by using the *IMM(CCR) approach* in accordance with Division 2 of Part 6A of the BCR.

11. **Variation margin** held by a CCP which is due to the reporting institution as a clearing member of the CCP but not yet received by the institution should be regarded as a default risk exposure to the CCP. The amount of the variation margin should be reported in the column “Principal Amount” and either in the column “**Non-IMM(CCR)** Default Risk Exposure” or the column “**IMM(CCR)** Default Risk Exposure”, as the case requires. The same reporting treatment applies to **initial margin** posted by the institution and held by the CCP.
12. “**Collateral posted** Principal Amount” in Division B captures credit exposures mentioned in paragraphs 3(b)(i)(B) and (ii)(C) above, but does not cover items mentioned in paragraph 11.
13. “Total Exposure After CRM” in Division B means the total of the exposures reported in the columns “**Non-IMM(CCR)** Default Risk Exposure”, “**IMM(CCR)** Default Risk Exposure” and “**Collateral posted** Principal Amount” after taking into account the credit risk mitigating effect of any **recognized credit risk mitigation** (CRM) afforded to the exposures concerned, except any **recognized collateral** or **recognized netting** that has already been taken into account in the default risk exposure calculations mentioned in paragraphs 9 and 10.
14. “Risk-weighted Amount” in Division B means the amount calculated by multiplying the amount reported in “Total Exposure After CRM” by the risk-weight applicable to the amount concerned.

Specific Instructions

Division A: Default Fund Contribution

15. Reporting institutions that are clearing members of CCPs should report their credit exposures to the CCPs arising from default fund contributions in item 1 and item 2 as follows.

<u>Item</u>	<u>Nature of Item</u>
<i>1.</i>	<u>Qualifying CCPs</u>

Report in the column “Default fund contribution” of item *1a* or *1b*, as the case requires, the total amount of funded default fund contributions made by the reporting institution to QCCPs’ mutualized loss-sharing arrangements.

Reporting institutions that have chosen to apply a risk-weight of 1250% to their funded default fund contributions under section 226X(4) of the BCR should fill in item *1a*.

Reporting institutions that have chosen to use Formula 23K to calculate the capital charge for their default fund contributions

under section 226X(4) of the BCR should fill in item *1b*.

- 1a.* Report in the column “Risk-weighted Amount” the risk-weighted amount of the funded default fund contributions to QCCPs calculated by multiplying the amount reported in column “Default fund contribution” by the risk-weight of 1250%.

Report in the column “Adjusted Risk-weighted Amount” the RWA_i for $QCCP_i$ calculated as follows:

$$RWA_i = \text{Min}\{(2\% * TE_i + 1250\% * DF_i); 20\% * TE_i\} - 2\% * TE_i$$

where—

TE_i = the total default risk exposure of the reporting institution to $QCCP_i$

DF_i = funded default fund contribution made by the reporting institution to $QCCP_i$

- 1b.* Report in the column “Capital Charge” the aggregate regulatory capital for the institution’s default fund contributions to QCCPs calculated in accordance with sections 226X(4) and 226Y of the BCR.

Report in the column “Adjusted Risk-weighted Amount” the risk-weighted amount of the institution’s default fund contributions to QCCPs calculated by multiplying the amount reported in the column “Capital Charge” by 12.5.

2. Non-qualifying CCPs

Report in the column “Default fund contribution” the total amount of funded default fund contribution made by the reporting institution, and the unfunded default fund contribution that the reporting institution is liable to pay, to non-QCCPs’ mutualized loss-sharing arrangements.

Report in the column “Adjusted Risk-weighted Amount” the risk-weighted amount of the default fund contributions to non-QCCPs calculated by multiplying the amount reported in the column “Default fund contribution” by the risk-weight of 1250%.

Division B: Default Risk Exposures

16. Reporting institutions that are clearing members of CCPs should report their credit exposures to the CCPs in items *1a* to *2h*. Item *1* is for the institutions’ credit exposures to QCCPs while items *2a* to *2h* are for the institutions’ credit exposures to non-QCCPs.

<u>Item</u>	<u>Nature of Item</u>
-------------	-----------------------

<i>1.</i>	<u>Qualifying CCPs</u>
-----------	------------------------

<i>1a.</i>	<u>Risk-weight 0%</u>
------------	-----------------------

This item is for the reporting of credit exposures to QCCPs that are covered by recognized CRM of which the applicable risk-weight is 0% (see detailed reporting arrangements in paragraphs 19 and 20 below).

<i>1b.</i>	<u>Risk-weight 2%</u>
------------	-----------------------

Report in the column “**Derivative Contracts and SFTs Principal Amount**” the total principal amount of the institution’s derivative contracts and SFTs with QCCPs. Also report in this column the aggregate amount of initial margin and variation margin mentioned in paragraph 11.

Report in the column “**Non-IMM(CCR) Default Risk Exposure**” the default risk exposures in respect of transactions or contracts for which the reporting institution does not have an **IMM(CCR) approval** or for which the reporting institution is permitted under section 10B(5) or (7) of the BCR not to use the IMM(CCR) approach. Also report in this column the aggregate amount of initial margin and variation margin mentioned in paragraph 11 in connection with the transactions or contracts reported in this column.

Report in the column “**IMM(CCR) Default Risk Exposure**” the default risk exposures in respect of transactions or contracts for which the reporting institution has an IMM(CCR) approval to use the IMM(CCR) approach. Also report in this column the aggregate amount of initial margin and variation margin mentioned in paragraph 11 in connection with the transactions or contracts reported in this column.

Also, include in the column “**Non-IMM(CCR) Default Risk Exposure**” or “**IMM(CCR) Default Risk Exposure**”, as the case requires, the default risk exposures to the QCCPs arising from guarantees provided by the institution to its clients for any loss due to changes in the value of the clients’ transactions in the event that the CCPs default.

The reporting institution should fill in the column “**Total Exposure After CRM**” in accordance with the reporting arrangements set out in paragraphs 19 and 20 below.

Report in the column “**Risk-weighted Amount**” the total risk-

weighted amount, which is the product of “Total Exposures after CRM” and the risk-weight of 2%.

1c. Other risk-weights not specified above

This item is for the reporting of credit exposures to QCCPs -

- that are covered by recognized CRM of which the applicable risk-weight is lower than 2% but greater than 0% (see detailed reporting arrangements in paragraphs 19 and 20 below); or
- that are risk-weighted in accordance with Part 4, 5 or 6 of the BCR (e.g. excess margin and collateral other than those mentioned in paragraph 11 posted with and held by a QCCP).

The institution should report the corresponding risk-weight in the column “Risk-weight %”.

2a. to 2h. Non-qualifying CCPs

Report the total principal amount of the institution’s derivative contracts and SFTs with a non-QCCP in the column “**Derivative Contracts and SFTs** Principal Amount” and in the row for the risk-weight applicable to the CCP under the *STC approach*. Also report in this column the aggregate amount of initial margin and variation margin mentioned in paragraph 11.

Report in the column “**Non-IMM(CCR)** Default Risk Exposure” and in the same row the default risk exposures in respect of transactions or contracts with the non-QCCP for which the reporting institution does not have an IMM(CCR) approval or for which the reporting institution is permitted under section 10B(5) or (7) of the BCR not to use the IMM(CCR) approach. Also report in this column the aggregate amount of initial margin and variation margin mentioned in paragraph 11 in connection with the transactions or contracts reported in this column.

Report in the column “**IMM(CCR)** Default Risk Exposure” and in the same row the default risk exposures in respect of transactions or contracts with the non-QCCP for which the reporting institution has an IMM(CCR) approval to use the IMM(CCR) approach. Also report in this column the aggregate amount of initial margin and variation margin mentioned in paragraph 11 in connection with the transactions or contracts reported in this column.

Also, include in the column “**Non-IMM(CCR)** Default Risk Exposure” or “**IMM(CCR)** Default Risk Exposure”, as the case requires, the default risk exposures to the non-QCCP arising

from guarantees provided by the institution to its clients for any loss due to changes in the value of the clients' transactions in the event that the CCP defaults.

Fill in the column "Total Exposure After CRM" in accordance with the reporting arrangements set out in paragraphs 19 and 20 below.

Report in the column "Risk-weighted Amount" the total risk-weighted amount for each row by multiplying the "Total Exposures after CRM" of that row by the risk-weight allocated to that row.

If the risk-weight applicable to an exposure after CRM is other than those specified in items 2a to 2g, the institution should report the exposure in item 2h and specify the risk-weight of that item in the column "Risk-weight %".

17. Reporting institutions that are clients of clearing members of CCPs should report in items 3a to 4h exposures to the clearing members as if they were exposures to the CCPs if all or certain conditions specified in section 226ZA(6) of the BCR are met.

<u>Item</u>	<u>Nature of Item</u>
3.	<u>Qualifying CCPs</u>
3a.	<u>Risk-weight of 0%</u>

This item is for the reporting of credit exposures to clearing members that are covered by recognized CRM of which the applicable risk-weight is 0% (see detailed reporting arrangements in paragraphs 19 and 20 below).

3b.	<u>Risk-weight 2%</u>
-----	-----------------------

This item captures exposures in respect of which all the conditions set out in section 226ZA(6) of the BCR are met.

Report in the column "**Derivative Contracts and SFTs Principal Amount**" the total principal amount of CCP-related transactions with the clearing members, total principal amount of transactions with QCCPs that are guaranteed by the clearing members. Also report in this column the aggregate amount of initial margin and variation margin mentioned in paragraph 11.

Report in the column "**Non-IMM(CCR) Default Risk Exposure**" the default risk exposures and *outstanding default risk exposures* in respect of transactions or contracts for which the reporting institution does not have an IMM(CCR) approval or for

which the reporting institution is permitted under section 10B(5) or (7) of the BCR not to use the IMM(CCR) approach. Also report in this column the aggregate amount of initial margin and variation margin mentioned in paragraph 11 in connection with the transactions or contracts reported in this column.

Report in the column “**IMM(CCR)** Default Risk Exposure” the default risk exposures and outstanding default risk exposures in respect of transactions or contracts for which the reporting institution has an IMM(CCR) approval to use the IMM(CCR) approach. Also report in this column the aggregate amount of initial margin and variation margin mentioned in paragraph 11 in connection with the transactions or contracts reported in this column.

Report in the column “**Collateral posted** Principal Amount” the fair value of the collateral posted by the institution (other than those that has already been reported in other columns) where the collateral is held by a QCCP on the institution’s behalf in a manner that is not bankruptcy remote.

Fill in the column “Total Exposure After CRM” in accordance with the reporting arrangements set out in paragraphs 19 and 20 below.

3c. Risk-weight of 4%

Report in this item exposures in respect of which all the conditions set out in section 226ZA(6), except section 226ZA(6)(a)(iii), of the BCR are met.

The detailed reporting arrangements for each of the columns are the same as those for item *3b*.

3d. Other risk-weights not specified above

This item is for the reporting of credit exposures to QCCPs -

- that are covered by recognized CRM of which the applicable risk-weight is lower than 4% but is not equal to 2% or 0% (see detailed reporting arrangements in paragraphs 19 and 20 below); or
- that are risk-weighted in accordance with Part 4, 5 or 6 of the BCR (e.g. excess margin and collateral other than those mentioned in paragraph 11 posted with and held by a QCCP).

4a. to 4h. Non-qualifying CCPs

Report in these items exposures in respect of which all the

conditions set out in section 226ZA(6), except section 226ZA(6)(a)(iii), of the BCR are met.

The detailed reporting arrangements for each of the columns are the same as those for items 2a to 2h.

CRM Treatments

18. In paragraphs 19 and 20, recognized CRM refers to recognized CRM –
- (a) that is afforded to credit exposures that fall within the scope of this Form; and
 - (b) the credit risk mitigating effect of which has not been taken into account in the default risk exposure calculation of the transactions or contracts concerned.
19. The reporting institution should take into account the recognized CRM in a manner permitted under Division 4 of Part 6A of the BCR. In other words –
- (a) in the case of exposures to non-qualifying CCPs, the institution, regardless of the approach adopted by it for the calculation of credit risk for non-securitization exposures, should take into account the CRM effect of recognized CRM in accordance with Part 4 of the BCR;
 - (b) in the case of exposures to qualifying CCPs –
 - (i) AIs using the **BSC approach** should take into account the CRM effect of recognized CRM in accordance with Part 5 of the BCR;
 - (ii) AIs using the STC approach should take into account the CRM effect of recognized CRM in accordance with Part 4 of the BCR;
 - (iii) AIs using the **IRB approach** should take into account the CRM effect of recognized CRM in the following manner:
 - (A) in relation to recognized collateral, AIs should apply Formula 19 and in accordance with section 160(3) of the BCR, and take the resulting net credit exposure (E*) as the basis for determining the risk-weighted amount of the exposures to qualifying CCPs, and paragraph 20(b) below for the reporting of these exposures in this Form with all necessary modifications; and
 - (B) in relation to recognized guarantees and recognized credit derivative contracts –
 - (1) subject to paragraph (2) below, AIs should apply Part 4 of the BCR for recognition of the CRM effect in determining the risk-weighted amount of the exposures to qualifying CCPs, and paragraph 20(a) below for the reporting of these

exposures in this Form;

(2) if –

- an exposure to a qualifying CCP is fully covered by a recognized guarantee or recognized credit derivative contract; and
- the institution uses the IRB approach to calculate its credit risk for the exposure to the guarantor of the guarantee concerned or the counterparty to the credit derivative contract concerned, as the case may be,

AIs must apply Part 6 of the BCR for recognition of the CRM effect in determining the risk-weighted amount of the exposure to the CCP (i.e. by allocating the risk-weight attributable to the credit protection provider as determined under the IRB approach to the CCP exposure), and paragraph 20(a) below for the reporting of the exposure in this Form with all necessary modifications.

20. The reporting institution should report the exposure amount (after taking into account recognized CRM) in the following manner –

- (a) CRM treatment by substitution of risk-weights (applicable to ***recognized guarantees, recognized credit derivative contracts*** and recognized collateral (i.e. the BSC approach and the ***simple approach*** under the STC approach)):
- (i) First, divide the default risk exposure (or the principal amount in the case of collateral posted) into two portions: the ***credit protection covered portion*** and the ***credit protection uncovered portion***;
 - (ii) Second, report the credit protection covered portion in the column “Total Exposure After CRM” and in the row for the risk-weight applicable to the ***credit protection provider*** or the recognized collateral; and
 - (iii) Lastly, report the credit protection uncovered portion in the column “Total Exposure After CRM” and in the row for the risk-weight applicable to the CCP determined in accordance with Division 4 of Part 6A of the BCR.
- (b) CRM treatment by reduction of principal amount of exposures (applicable to recognized collateral (i.e. the ***comprehensive approach*** under the STC approach)):
- (i) Subtract the value of the recognized collateral (after applying appropriate ***standard supervisory haircuts*** to the collateral) from the default risk exposure (or the principal amount in the case of collateral

posted) in accordance with Formula 4 of section 89 of the BCR (in the case of derivative contracts) or Formula 3 of section 88 of the BCR (in the case of SFTs and collateral posted); and

- (ii) Report the net credit exposure in the column “Total Exposure After CRM” and in the row for the risk-weight applicable to the CCP determined in accordance with Division 4 of Part 6A of the BCR.

Hong Kong Monetary Authority
June 2013

Completion Instructions

Return of Capital Adequacy Ratio Part IIIf – Risk-weighted Amount for CVA Form MA(BS)3(IIIf)

Introduction

1. Form MA(BS)3(IIIf) of Part III should be completed by all authorized institutions incorporated in Hong Kong using the *advanced CVA method* or the *standardized CVA method* to calculate *CVA capital charge* under Division 3 of Part 6A of the Banking (Capital) Rules (BCR).
2. Reporting institutions should report in this Form the CVA capital charge calculated for all their counterparties (including *clearing members* or *clients* in respect of transactions or contracts cleared by *central counterparties*, where applicable) in respect of the following contracts and transactions booked in the institutions' *banking book* and *trading book*:
 - (a) *derivative contracts* (including *long settlement transactions*); and
 - (b) *securities financing transactions* (including long settlement transactions) if required by the Monetary Authority (MA) under section 10A(6) of the BCR.
3. Reporting institutions are not required to calculate CVA capital charge for items specified in Schedule 1A to the BCR.
4. The Form is divided into two divisions:
 - (a) Reporting institutions that are eligible to use the advanced CVA method (see section 10A(3) and (4) of the BCR) should complete Division A in respect of contracts and transactions for which the CVA capital charge is calculated under the advanced CVA method.
 - (b) Where a reporting institution that is eligible to use the advanced CVA method is required to use the standardized CVA method to calculate the CVA capital charge for certain transactions or counterparties (see section 10C of the BCR), the institution should report the transactions or counterparties concerned in Division B.
 - (c) All other reporting institutions (i.e. those that are required to use the standardized CVA method) should complete Division B, including reporting institutions that are no longer eligible to use the advanced CVA method (see section 10D of the BCR).
5. This Form and its completion instructions should be read in conjunction with the BCR and the relevant supervisory policy/guidance related to the revised capital adequacy framework.

Specific Instructions

6. A reporting institution should not include a CVA hedge in its CVA capital charge calculation unless the hedge is an **eligible CVA hedge** (see section 226T of the BCR).
7. For the calculation of EAD_i^{total} under Formula 23J in section 226S(1) of the BCR, a reporting institution that concurrently uses –
 - (a) the **IRB approach** to calculate its **credit risk** for **non-securitization exposures** to the counterparty, and
 - (b) the **current exposure method** or the methods referred to in section 10A(1)(b) of the BCR for the calculation of its **default risk exposures** in respect of derivative contracts or securities financing transactions, as the case may be,may recognise the credit risk mitigating effect of **recognized collateral**¹ by applying Formula 19 and in accordance with section 160(3) of the BCR, and take the resulting net credit exposure (E*) as the basis for determining the EAD_i^{total} of a **netting set** in accordance with other applicable provisions of section 226S of the BCR.
8. To avoid double-counting, the institution should ensure that the **expected exposures** (EEs) (in the case of advanced CVA method) or EAD_i^{total} (in the case of standardized CVA method) used in the CVA capital charge calculations have not been adjusted for the credit risk or CVA risk mitigation effect of any eligible CVA hedges that the institution intends to use to reduce its CVA capital charge.
9. Recognized credit derivative contracts purchased for hedging default risk exposures to counterparties should be included in the CVA capital charge calculation in the manner mentioned in section 226P(5) or 226S(7) of the BCR, as the case requires.

Division A: Advanced CVA Method

10. The reporting institution should generate the VaR and stressed VaR by using the VaR model approved by the MA for calculating the specific risk for interest rate exposures under the **IMM approach** and in accordance with sections 226P, 226Q and 226T of the BCR.

Item 1 – VaR

11. Item 1 refers to the VaR calculated based on EEs that are estimated using parameters calibrated to current market data.
12. Report in the column “End of quarter” the VaR as at the last trading day of the reporting quarter.
13. Report in the column “Average VaR” the average VaR for the last 60 trading days. The

¹ See definition of “recognized collateral” in section 139(1) of the BCR.

VaR of each trading day should be generated as mentioned in paragraph 10 above.

14. Report in the column “Multiplication factor for VaR” the multiplication factor (m_c) determined in the same manner as in section 319(1) of the BCR. The minimum value of the multiplication factor is 3.
15. Report in the column “Risk-weighted Amount” the *CVA risk-weighted amount* calculated based on the following formula:

$$\begin{aligned} \text{CVA risk-weighted amount} = \\ \text{Max [VaR as at the last trading day of the reporting quarter; Average VaR for the} \\ \text{last 60 trading days} \times m_c] \times 12.5 \end{aligned}$$

Item 2 – Stressed VaR

16. Item 2 refers to the stressed VaR calculated based on EEs that are estimated using a stress calibration as set out in section 3(f)(i) of Schedule 2A of the BCR. The period of stress should be the most severe 1-year stress period within the 3-year period used for the stress calibration.
17. Report in the column “Latest available” the reporting institution’s latest available stressed VaR.
18. Report in the column “Average Stressed VaR” the average stressed VaR for the last 60 trading days. The stressed VaR of each trading day should be generated as mentioned in paragraph 10 above.
19. Report in the column “Multiplication factor for Stressed VaR” the multiplication factor (m_s) determined in the same manner as in section 319(4) of the BCR. The minimum value of the multiplication factor is 3.
20. Report in the column “Risk-weighted Amount” the CVA risk-weighted amount calculated based on the following formula:

$$\begin{aligned} \text{CVA risk-weighted amount} = \\ \text{Max [Latest available stressed VaR; Average stressed VaR for the last 60 trading} \\ \text{days} \times m_s] \times 12.5 \end{aligned}$$

Division B: Standardized CVA Method

Item 3

21. The column “Default Risk Exposures” refers to the sum of the default risk exposures of all the reporting institution’s netting sets (i.e. EAD_i^{total} in Formula 23J in section 226S of the BCR) that are subject to the CVA capital charge requirement. The amount reported in the column should be the amount before applying the discount factor as required by section 226S(1)(c) of the BCR.
22. The column “Capital Charge” refers to the CVA capital charge for a portfolio of

counterparties calculated in accordance with sections 226S and 226T of the BCR.

23. When using Formula 23J,

- (a) if the reporting institution has more than one netting set with counterparty “i”, the institution should multiply the default risk exposure (EAD_i) (after applying the discount factor mentioned in section 226S(1)(c)(i) of the BCR, if applicable) of each of the netting sets by the netting set’s effective maturity (M_i) and then aggregate the product obtained (i.e. $M_i \cdot EAD_i$) for each netting set, and use the aggregate as the input for $M_i \cdot EAD_i^{total}$ in Formula 23J;
- (b) if there is more than one single-name eligible CVA hedge for hedging the **CVA risk** in respect of counterparty “i”, the institution should multiply the notional amount (B_i) (after applying the discount factor mentioned in section 226S(1)(d) of the BCR) of each eligible CVA hedge by its maturity (M_i^{hedge}) and then aggregate the product obtained (i.e. $M_i^{hedge} \cdot B_i$) for each eligible CVA hedge, and use the aggregate as the input for $M_i^{hedge} \cdot B_i$ in Formula 23J;
- (c) if there is more than one index eligible CVA hedge for hedging CVA risk, the institution should multiply the notional amount (B_{ind}) (after applying the discount factor mentioned in section 226S(1)(e)(i) of the BCR) of each index eligible CVA hedge by its maturity (M_{ind}) and then aggregate the product obtained (i.e. $M_{ind} \cdot B_{ind}$) for each eligible CVA hedge, and use the aggregate as the input for $M_{ind} \cdot B_{ind}$ in Formula 23J; and
- (d) if the reporting institution falls within the description of paragraph 7(a) and (b), it may take into account the credit risk mitigating effect of collateral in the calculation of EAD_i^{total} in accordance with that paragraph.

24. Report in the column “Risk-weighted Amount” the CVA risk-weighted amount calculated based on the following formula:

$$\text{CVA risk-weighted amount} = \text{CVA capital charge} \times 12.5$$

Completion Instructions

Return of Capital Adequacy Ratio Part IV – Risk-weighted Amount for Market Risk Form MA(BS)3(IV)

Introduction

1. Form MA(BS)3(IV) should be completed on a quarterly basis by each authorized institution incorporated in Hong Kong which is not exempted by the Monetary Authority (MA) from the calculation of *market risk*. The MA will not grant any exemption to an institution using the *internal ratings-based approach (IRB approach)* to calculate its *credit risk*, no matter whether it meets the de minimis exemption criteria.
2. A reporting institution which is exempted by the MA from the calculation of market risk should complete this Form once in a year for the *position* at the last calendar day of December for the annual assessment of its exemption status. However, the *risk-weighted amount for market risk* reported in this Form by an exempted institution will be for information only, and will be automatically excluded from the calculation of its capital adequacy ratios in Part I of the Return. An exempted institution should continue to calculate the *credit risk* for its relevant market risk positions and complete Form MA(BS)3(IIIa), MA(BS)3(IIIb), MA(BS)3(IIIc), MA(BS)3(IIId) or MA(BS)3(IIIe) of the Return, whichever is applicable, in the same manner as the credit risk for those positions is calculated and reported at other quarter-ends. A newly authorized institution is required to report its market risk positions for the first four consecutive *calendar quarters* before the MA can make the first assessment on whether the institution qualifies for the exemption status.
3. This Form and its completion instructions should be read in conjunction with the Banking (Capital) Rules and the relevant supervisory guidelines relating to the market risk capital framework. The reporting institution should refer to section 2 and Part 8 of the Rules for the definition of the terms in bold and italics used in this Form and its completion instructions.

Section A: Definitions and Clarification

4. A reporting institution should use the *standardized (market risk) approach (STM approach)* to calculate its market risk unless it has obtained the MA's approval to use the *internal models approach (IMM approach)*. The MA may also approve a reporting institution to use the IMM approach to calculate its market risk in respect of *general market risk* or *specific risk*, or both, for such *risk categories* or such local or overseas business of the institution specified by the MA (see paragraph 8). Any reporting institution which has been approved by the MA to use the IMM approach to calculate its market risk –

- (a) is nevertheless required to adopt the STM approach to calculate the market risk capital charge for specific risk in accordance with paragraph 114 of the instructions; and
 - (b) cannot revert to the STM approach, except with the MA's *prior consent*.
- 5. Subject to paragraph 6, a reporting institution should calculate its market risk to take into account the risk of losses arising from fluctuations in the value of:
 - (a) the institution's *trading book* positions held in *debt securities, debt-related derivative contracts, interest rate derivative contracts, equities and equity-related derivative contracts*; and
 - (b) the institution's positions held in foreign exchange (including gold), *exchange rate-related derivative contracts, commodities and commodity-related derivative contracts*.
- 6. A reporting institution should not include a position in the calculation of its market risk if the position is:
 - (a) a *recognized credit derivative contract* booked in the institution's trading book as a hedge to a credit exposure booked in the institution's *banking book*;
 - (b) an exposure required to be deducted from any of the institution's *Common Equity Tier 1 capital, Additional Tier 1 capital and Tier 2 capital* in Part II of the Return of Capital Adequacy Ratio; or
 - (c) an *eligible CVA hedge*
- 7. A reporting institution should comply with section 4A of the Rules when valuing its trading book positions, whether based on a *marking-to-market* or *marking-to-model* methodology. Among other things, this means the institution must value its positions in a prudent and reliable manner and consider making *valuation adjustment* to its positions as appropriate (including by taking into account the limitation of the valuation model or methodology and the data used by the institution in the valuation process, the liquidity of the positions and other relevant factors that might reasonably be expected to affect the prudence and reliability of the valuation of the positions).
- 8. A reporting institution should complete various divisions of this Form according to the following instructions:
 - (a) a reporting institution using the STM approach should complete Divisions A to E and Division G of the Form;
 - (b) a reporting institution using the IMM approach should complete (i) (where applicable) Division A1(b), (c) and (d); and (ii) Divisions F and G, of the Form; and
 - (c) a reporting institution using a combination of the IMM approach and STM approach should complete Divisions A to G of the Form.

9. The guidance for the calculation of *market risk capital charge* for credit derivative contracts booked in a reporting institution's trading book is set out in **Annex IV-A**.
10. An illustration based on a hypothetical portfolio on how various types of *financial instruments* are reported and how market risk capital charges are calculated under the STM approach is shown in **Annex IV-B**.

Section B: STM Approach to the Calculation of Market Risk

11. The completion instructions in this section apply to reporting institutions adopting the STM approach to calculate the market risk capital charge for general market risk, specific risk, or both, in respect of all or individual exposure types covered in this section. Such institutions include those approved by the MA to use the IMM approach to calculate market risk for their *specific risk interest rate exposures* but are required under the Rules to use the STM approach in respect of specified trading book positions as set out in sections B.1.1.2 and B.1.1.4 and, where applicable, B.1.1.3.
12. Unless otherwise specified, a reporting institution should use the *fair value* of its positions to calculate the market risk capital charge. Where the stated *notional amount* of an exposure held by a reporting institution is leveraged or enhanced by the structure of the exposure, the institution should use the effective notional amount of the exposure (being the stated notional amount of the exposure adjusted to take into account the effect of the leverage or enhancement provided by the structure of the exposure) for the purpose of calculating the market risk capital charge.

B.1 Interest Rate Exposures (Trading Book)

13. This subsection describes the framework for calculating the market risk capital charge for a reporting institution's interest rate exposures booked in the trading book. The calculation treatment of interest rate exposures relating to *option contracts* is separately described in section B.5.
14. A reporting institution should, for the purposes of calculating the market risk capital charge for its interest rate exposures-
 - (a) calculate the market risk capital charge for specific risk for each of its trading book positions (whether long or short) in debt securities and debt-related derivative contracts-
 - (i) in accordance with section 287 of the Rules if these positions arise from *non-securitization exposures*¹ which do not fall within subparagraph (iii) or (iv) of section 286(a) of the Rules;
 - (ii) in accordance with section 287A of the Rules if these positions arise from *securitization exposures*¹ which do not fall within subparagraph (iii) of section 286(a) of the Rules;
 - (iii) in accordance with section 287B of the Rules if these positions fall within a *correlation trading portfolio*; and
 - (iv) in accordance with sections 287 and Division 10 of the Rules if these positions arise from credit derivative contracts which do not fall within subparagraph (ii) or (iii) of section 286(a) of the Rules;

¹ Securitization exposures include *re-securitization exposures* unless stated otherwise.

- (b) subject to paragraph (c), calculate in accordance with section 288 of the Rules the market risk capital charge for general market risk for:
 - (i) its trading book positions (whether long or short) in debt securities, debt-related derivative contracts and interest rate derivative contracts;
 - (ii) the interest rate exposures arising from its trading book positions (whether long or short) in equity-related derivative contracts; and
 - (iii) the interest rate exposures arising from its positions (whether long or short) in commodity-related derivative contracts; and
 - (c) calculate in accordance with section 288 and Division 10 of the Rules the market risk capital charge for general market risk for the interest rate exposures arising from its trading book positions (whether long or short) in credit derivative contracts.
15. A reporting institution should follow section 76, 123 or 202 of the Rules, as the case requires, for the calculation of the *risk-weighted amount* of exposures in respect of assets underlying *securities financing transactions* booked in the trading book; and section 76A, 123A or 202 of the Rules, as the case requires, for the calculation of the risk-weighted amount of default risk exposures in respect of securities financing transactions.

B.1.1 Interest rate exposures – specific risk

16. For the purposes of section B.1.1, a reference to AIs adopting the STM approach refers to reporting institutions that do not have the MA's approval to use the IMM approach to calculate the market risk capital charge for specific risk for interest rate exposures; whereas a reference to AIs adopting the IMM approach refers to reporting institutions that have the MA's approval to use the IMM approach to calculate the market risk capital charge for specific risk for interest rate exposures but are nevertheless required to adopt the STM approach to calculate the market risk capital charge for specific risk for certain types of market risk exposures in accordance with paragraph 114 of the completion instructions.

B.1.1.1 Division A.1(a) of Form MA(BS)3(IV) – Non-securitization exposures that do not fall within a correlation trading portfolio and that are not n^{th} -to-default credit derivative contracts (*Applicable to AIs adopting the STM approach*)

17. A reporting institution is required to report in Division A.1(a) of the Form the market risk capital charge for specific risk for its trading book positions in specific risk interest rate exposures that satisfy all of the following criteria: (a) they are non-securitization exposures; (b) they do not fall within a correlation trading portfolio; and (c) they are not *n^{th} -to-default credit derivative contracts*. Such positions are referred to as “relevant” specific risk interest rate exposures for the purposes of Division A.1(a).

18. A reporting institution should assign each of its trading book positions (whether long or short) in relevant specific risk interest rate exposures into items 1.1 to 1.13 of Division A.1(a) of the Form based on the classes, the **credit quality grades** and, if applicable, the residual maturities, of such positions in accordance with **Table 1**; and report the respective grand totals for long and for short positions in item 1.14. The institution should follow the instructions set out in **Annex IV-A** for calculation and reporting of market risk capital charge for credit derivative contracts.
19. The reporting institution should then multiply the total positions (i.e. long plus short positions) for each column reported in item 1.14 by the appropriate **market risk capital charge factors** for specific risk specified in item 1.15 of Division A.1(a) of the Form. The total market risk capital charge for specific risk of each column reported in item 1.16 (except the last column) is equal to the product of item 1.14 and item 1.15 under the same column, adjusted for the effect of the maximum possible loss provision for credit derivative contracts that the institution may adopt in accordance with paragraph 20. The grand total of market risk capital charge for specific risk reported in the last column of item 1.16 is equal to the sum of the market risk capital charge for specific risk of each of the other columns.

Table 1: Market risk capital charge factors for specific risk

Class	Credit quality grade	Market risk capital charge factor for specific risk
Sovereign	1	0%
	2 or 3	0.25% (residual maturity of not more than 6 months)
		1.00% (residual maturity of more than 6 months but not more than 24 months)
		1.60% (residual maturity of more than 24 months)
	4 or 5	8.00%
	6	12.00%
	Unrated	8.00%
Qualifying		0.25% (residual maturity of not more than 6 months)
		1.00% (residual maturity of more than 6 months but not more than 24 months)
		1.60% (residual maturity of more than 24 months)
Non-qualifying	4	8.00%
	5	12.00%
	Unrated	8.00%

20. The market risk capital charge for specific risk for a reporting institution's positions in a credit derivative contract (other than an nth-to-default credit derivative contract) may be capped at the maximum possible loss arising from the contract, which should be calculated for each individual position as:
 - (a) where the institution is a protection buyer, the change in the value of the contract in the event that all the **reference obligations** specified in the contract were to become immediately default risk-free;
 - (b) where the institution is a protection seller, the change in the value of the contract in the event that all the reference obligations specified in the contract were to default immediately with zero recoveries.
21. A reporting institution should not offset between positions in the relevant specific risk interest rate exposures except for:
 - (a) long and short positions in identical issues (including positions in **derivative contracts**); and
 - (b) credit derivative contracts as set out in paragraphs 10 to 13 of **Annex IV-A**.
22. For the purposes of paragraph 19, if:
 - (a) the issuer of any debt securities or, in the case of debt-related derivative contracts, the issuer of any underlying debt securities, has an **ECAI issuer rating**; or
 - (b) any debt securities or, in the case of debt-related derivative contracts, any underlying debt securities, have an **ECAI issue specific rating**,

a reporting institution should, subject to paragraphs 23 to 26, map the ECAI issuer rating or the ECAI issue specific rating, as the case may be, to a scale of credit quality grades in accordance with the tables set out in Annex IIIb-A of the completion instructions for Part IIIb of the Return of Capital Adequacy Ratio.
23. Subject to paragraph 26, in the case of debt securities issued by a sovereign or, in the case of debt-related derivative contracts where the underlying debt securities are issued by a sovereign, a reporting institution should determine the credit quality grade by reference to the ECAI issuer rating of that sovereign. In this context, “**sovereign**” includes a **sovereign foreign public sector entity**.
24. Subject to paragraph 26, the credit quality grade of debt securities issued by a **public sector entity** or, in the case of debt-related derivative contracts where the underlying debt securities are issued by a public sector entity, is determined by reference to the ECAI issuer rating of the sovereign of the jurisdiction in which the public sector entity concerned is incorporated.
25. Subject to paragraph 26, in the case of other non-sovereign debt securities or non-sovereign debt-related derivative contracts, a reporting institution should determine the credit quality grade by reference to, in the case of debt securities, the ECAI issue

specific rating of the debt securities or, in the case of debt-related derivative contracts, the ECAI issue specific rating of the underlying debt securities.

26. The institution should treat as unrated:

- (a) the issuer of any debt securities or, in the case of debt-related derivative contracts, the issuer of any underlying debt securities, referred to in paragraph 23, which does not have an ECAI issuer rating;
- (b) any debt securities or, in the case of debt-related derivative contracts, any underlying debt securities, referred to in paragraph 24, which do not have an ECAI issue specific rating; or the sovereign of the jurisdiction in which the public sector entity concerned is incorporated does not have an ECAI issuer rating; and
- (c) any debt securities or, in the case of debt-related derivative contracts, any underlying debt securities, referred to in paragraph 25, which do not have an ECAI issue specific rating.

27. A reporting institution may only assign a market risk capital charge factor of 0% to:

- (a) debt securities issued by a sovereign with a credit quality grade of 2 or 3 as determined under paragraph 23; or
- (b) debt-related derivative contracts in respect of which the underlying debt securities are issued by a sovereign with a credit quality grade of 2 or 3 as determined under paragraph 23,

if those debt securities or, in the case of those debt-related derivative contracts, those underlying debt securities, as the case may be, are denominated in the domestic currency of that sovereign and funded by the institution in that currency.

28. A reporting institution may only include in the qualifying class under items 1.6 to 1.10 of Division A.1(a) of the Form:

- (a) debt securities issued by multilateral development banks and debt-related derivative contracts where the underlying debt securities are issued by multilateral development banks;
- (b) debt securities issued by public sector entities and debt-related derivative contracts where the underlying debt securities are issued by public sector entities if:
 - (i) subject to paragraph 26(b), the debt securities or the underlying securities, as the case may be, are assigned a credit quality grade of 2 or 3 as determined under sub-paragraph (ii) below;
 - (ii) the credit quality grade referred to in sub-paragraph (i) above is determined as one grade below that assigned to the sovereign (which is determined in accordance with paragraphs 23 and 26(a)) of the

jurisdiction in which that public sector entity is incorporated² or, if there is no such lower credit quality grade, the credit quality grade applicable to that sovereign³;

- (c) debt securities, not falling within paragraph (a) or (b), which are rated **investment grade** and debt-related derivative contracts where the underlying debt securities, not falling within paragraph (a) or (b), which are rated investment grade; and
 - (d) if the institution uses the IRB approach to calculate its credit risk, unrated debt securities, and debt-related derivative contracts if the underlying debt securities are unrated, where:
 - (i) the debt securities, or the underlying debt securities, as the case may be, are assessed as equivalent to investment grade under the institution's **rating system** on the basis that the debt securities, or the underlying debt securities, as the case may be, have a **PD** assigned by the institution's rating system of not more than the PD implied by the long run average PD (being a period which captures a reasonable mix of high-default and low-default years of an economic cycle) of a debt security rated investment grade; and
 - (ii) the issuer of the debt securities, or the issuer of the underlying debt securities, as the case may be, has any debt securities or equities listed on a **recognized stock exchange** or is subject to supervisory arrangements regarding the maintenance of adequate capital to support its business activities comparable to those prescribed for authorized institutions under the Banking Ordinance and the Rules.
29. A reporting institution should include in the non-qualifying class under items 1.11 to 1.13 of Division A.1(a) of the Form any non-sovereign debt securities or non-sovereign debt-related derivative contracts which are not included in the qualifying class under paragraph 28.
30. If debt securities issued by public sector entities or debt-related derivative contracts where the underlying debt securities are issued by public sector entities are assigned a credit quality grade of 6 under paragraph 28(b)(ii), such securities or contracts, as the case may be, should be subject to the same market risk capital charge factor as that assigned to the "non-qualifying" positions that are assigned a credit quality grade of 5 (i.e. 12.00%) as set out in column 3 of the second last row of **Table 1**.
31. If:

² This means if the sovereign has a credit quality grade of 1, a public sector entity under that sovereign will be assigned a credit quality grade of 2 and so on.

³ This means if the sovereign has a credit quality grade of 6 (the lowest grade), a public sector entity under that sovereign will also be assigned a credit quality grade of 6.

- (a) the issuer of any debt securities or, in the case of any debt-related derivative contracts, the issuer of any underlying debt securities, has more than one ECAI issuer rating assigned to the issuer; or
- (b) any debt securities or, in the case of any debt-related derivative contracts, any underlying debt securities, have more than one ECAI issue specific rating assigned to them,

a reporting institution should apply the principles set out in section 69(2) of the Rules to the *ECAI ratings* concerned to ascertain which one of them should be used.

32. If the MA is satisfied that a reporting institution's market risk capital charge for specific risk is underestimated for any non-qualifying debt securities or debt-related derivative contracts which have a high yield to redemption relative to any debt securities issued by a sovereign or any debt-related derivative contracts where the underlying debt securities are issued by a sovereign, the MA may:
- (a) require the institution to apply a higher market risk capital charge factor for specific risk to such non-qualifying debt securities or debt-related derivative contracts, as the case may be;
 - (b) prohibit offsetting, for the purposes of calculating the institution's market risk capital charge for general market risk between such non-qualifying debt securities or debt-related derivative contracts and any other debt securities or debt-related derivative contracts.

The market risk capital charge factor for specific risk specified by the MA for such non-qualifying debt securities or debt-related derivative contracts should be reported under the column "To be specified (%)" of Division A.1(a) of the Form.

33. Interest rate derivative contracts are not subject to a market risk capital charge for specific risk.

B.1.1.2 Division A.1(b) of Form MA(BS)3(IV) - Securitization exposures that do not fall within a correlation trading portfolio (*Applicable to AIs adopting the STM or IMM approach*)

34. A reporting institution is required to report in Division A.1(b) of the Form the market risk capital charge for specific risk for its trading book positions (whether long or short) in securitization exposures that do not fall within a correlation trading portfolio. Such positions are referred to as "relevant" specific risk interest rate exposures for the purposes of Division A.1(b).
35. According to the Basel Committee's revised securitisation framework for the banking book⁴, which is implemented in Hong Kong with effect from 1 January 2018, securitisation exposures held in the trading book should be subject to the revised

⁴ See the document entitled *Revisions to the securitisation framework* issued in December 2014 (revised in July 2016) by the Basel Committee.

framework for market risk (i.e. “Minimum capital requirements for market risk”) issued by the Basel Committee in January 2016. However, the revised market risk framework has yet to be implemented in Hong Kong. To bridge the gap in implementation of the two frameworks, the basis for calculating the market risk for securitization exposures held in the trading book of an AI will remain unchanged during the interim period (see section 287A of the Rules). The HKMA expects that AIs will not abuse this transitional treatment (e.g. by switching securitization exposures between their regulatory banking book and trading book for the purposes of *regulatory capital arbitrage*).

36. The treatment for securitization exposures held in the trading book aligns with that for securitization exposures held in the banking book **in the *pre-amended Rules***, subject to necessary modifications. Reporting institutions should therefore apply the completion instructions of Form MA(BS)3(IIIId) **as in force immediately before 1 January 2018, i.e. the set of completion instructions that was effective as at end-March 2016 (“pre-amend CI of Form MA(BS)3(IIIId)”)**⁵ in completing Division A.1(b) of this Form except as specified in paragraphs 37 to 42 below. In case of doubt, please consult the institutions’ usual supervisory contact.
37. A reporting institution should apply the **pre-amend CI of Form MA(BS)3(IIIId)** in relation to Division A.1(b) of Form MA(BS)3(IV) as if –
 - (a) a reference in the **pre-amend CI of Form MA(BS)3(IIIId)** to Table 1, 2, 3 or 4 were a reference to Table 28A, 28B, 28C or 28D in **Annex IV-D** respectively;
 - (b) a reference in the **pre-amend CI of Form MA(BS)3(IIIId)** to Annex IIIId-C or Table A, B, C or D therein were a reference to **Annex IV-D** or Table 28E, 28F, 28G or 28H therein respectively; and
 - (c) a reference in the **pre-amend CI of Form MA(BS)3(IIIId)** to risk-weight were a reference to market risk capital charge factor.
38. As an overview, a reporting institution should report in Division A.1(b) of the Form its trading book positions (whether long or short) in the relevant specific risk interest rate exposures as follows:
 - (a) Positions in *rated* securitization exposures and in other securitization exposures (e.g. *investors’ interest*) that are not subject to capital deduction are reported in Section A1 (if the securitization exposures concerned are subject to the *STC(S) approach*) or A2 (if the securitization exposures concerned are subject to the *IRB(S) approach*), based on the nature of the securitization exposures, credit quality grades, and whether the institution has incurred the positions in those exposures as an investing institution or originating institution;
 - (b) For positions in unrated securitization exposures (which, for the purposes of section B.1.1.2, refer to securitization exposures that are not rated or treated as if

⁵ Accessible at <http://www.hkma.gov.hk/eng/key-functions/banking-stability/banking-policy-and-supervision/regulatory-framework/3.shtml>.

not rated for regulatory capital purposes) that are not subject to capital deduction, report them in item 1.3 in section A if they are subject to the STC(S) approach; or in item 2.6 in section A if they are subject to the IRB(S) approach and to which the *supervisory formula method* or the method specified in section 277(3) of the **pre-amended Rules** apply;

- (c) Positions in securitization exposures (whether rated or unrated) that are subject to capital deduction should be reported in Section B; and
 - (d) The institution should not offset between trading book positions in securitization exposures except as provided for in section 287(2)(a) of the Rules. The credit risk mitigation rules in the banking book do not apply in the trading book. AIs must not therefore apply the credit risk mitigation framework under the banking book securitization framework to determine their securitization positions subject to market risk capital charges. (While the trading book regime allows the offsetting of long and short positions in identical issues, the banking book regime subjects long positions in securitization exposures held in AIs' banking books to credit risk capital charges and any permissible relief from identical short positions can only come from the application of strict credit risk mitigation provisions.)
39. Subject to paragraphs 40 and 41 below, for the purposes of calculating the market risk capital charge for specific risk for its trading book positions (whether long or short) in the relevant specific risk interest rate exposures that are not subject to deduction from its ***Common Equity Tier 1 capital, Additional Tier 1 capital and Tier 2 capital***, a reporting institution should -
- (a) first calculate a preliminary market risk capital charge for specific risk for each of the individual positions reported in Section A -
 - (i) subject to item (iii) below, for a position in rated securitization exposures reported in column (3), (4), (5) or (6) of item 1.1, 1.2, 2.1, 2.2, 2.3, 2.4 or 2.5 of Section A, by multiplying the position by the applicable market risk capital charge factor set out in the relevant table in **Annex IV-D** and recapped in column (7) or (8) in Section A;
 - (ii) subject to item (iii) below, for a position in securitization exposures reported in column (3), (4), (5) or (6) of item 1.3 or 2.6 of Section A, by multiplying the position by the applicable market risk capital charge factor as determined by applying the relevant **pre-amend CI of Form MA(BS)3(III d)**, bearing in mind that the market risk capital charge factor is equal to the corresponding risk-weight in that Form divided by 12.5; and
 - (iii) for a position in securitization exposures reported in column (3), (4), (5) or (6) under Section A, by multiplying the position by a market risk capital charge factor of 100% if it falls within any of the descriptions of exposures in sections 236(1)(a), (c), (d) and (da) and 251(1)(a), (c), (e), (ea) and (f) of the **pre-amended Rules**;

- (b) calculate an adjusted market risk capital charge for specific risk for the individual positions reported in Section A, by capping the respective preliminary market risk capital charge for specific risk for these positions at their respective maximum possible loss amount, which is calculated for each individual position as follows:
 - (i) for a short position, the maximum possible loss is calculated as the change in the value of the position in the event that all the underlying exposures were to become immediately default risk-free;
 - (ii) for a long position, the maximum possible loss is calculated as the change in the value of the position in the event that all the underlying exposures were to default immediately with zero recoveries;
- (c) report in columns (9) and (10) of items 1.1 to 2.7 of Section A respectively the adjusted market risk capital charge for specific risk for the institution's long and short trading book positions in the relevant specific risk interest rate exposures;
- (d) ensure that item 1.4 of each column in Section A is equal to the sum of items 1.1(f), 1.2(f) and 1.3;
- (e) ensure that the "Total" row of item 2.7 under Section A is equal to the sum of the sub-totals under row (m) of items 2.1 to 2.5 and item 2.6, with a further breakdown of positions and related market risk capital charge for specific risk for the positions in terms of (i) rated and unrated securitization (excluding re-securitization) exposures; and (ii) rated and unrated re-securitization exposures. Investors' interest, if any, should be included in item 2.7(a)(ii) or (b)(ii);
- (f) for columns (9) and (10) of item 2.8 of Section A, ensure that the market risk capital charge reported is equal to the corresponding total amount of adjusted market risk capital charge reported in item 2.7 multiplied by the scaling factor of 1.06, which is applicable only to securitization exposures subject to the IRB(S) approach;
- (g) for item 3 of Section A, ensure that the position columns (3) to (6) is equal to the sum of the total of items 1.4 and 2.7 of Section A; whereas the market risk capital charge columns (9) and (10) is equal to the sum of items 1.4 and 2.8 of Section A; and
- (h) report in column (11) of item 3 of Section A the applicable market risk capital charge for the relevant specific risk interest rate exposures as -
 - (i) during the *transitional period (securitization)* (i.e. 1 January 2012 to 31 December 2013, both dates inclusive), the *larger* of the total adjusted market risk capital charge for specific risk for the long positions in item 3(9) or the total adjusted market risk capital charge for specific risk for the short positions in item 3(10);

- (ii) after the transitional period (securitization), the *sum* of the adjusted market risk capital charge for specific risk for each of the positions (i.e. item 3(9) + item 3(10)).

The completion instructions set out in this paragraph are on the basis that the treatment under paragraph 20 is adopted by the institution. If the institution does not adopt the treatment under paragraph 20, the adjusted market risk capital charges for specific risk referred to in this paragraph will then be equal to the respective preliminary market risk capital charges for specific risk.

- 40. A reporting institution should, for the purposes of calculating the market risk capital charge for specific risk in respect of its unrated positions in securitization exposures subject to the IRB(S) approach, and subject to paragraphs 41 and 42 and with the MA's prior consent, use one of the following methods and apply it consistently-
 - (a) where the institution has obtained the MA's approval to use the IRB approach to calculate the credit risk capital charge for the **IRB class** or **IRB subclass** into which the **underlying exposures** of the positions are classified, the supervisory formula method as prescribed in Division 6 of Part 7 of the **pre-amended Rules**; or
 - (b) where the institution has obtained the MA's approval to use the IMM approach to calculate the **incremental risk charge** for the underlying exposures of such positions, the supervisory formula method as referred to in paragraph (a), but applying the estimates for PD and **LGD** produced by the internal model that the institution uses to calculate the incremental risk charge for calculating K_{IRB} ⁶ under the supervisory formula method.
- 41. In respect of a position referred to in paragraph 40, the institution should calculate in accordance with that paragraph the market risk capital charge for specific risk, subject to the floor that such market risk capital charge should not be lower than the market risk capital charge for specific risk applicable to a position in a rated and more senior tranche.
- 42. A reporting institution should report all its trading book positions (whether long or short) in securitization exposures that are subject to deduction from its **Common Equity Tier 1 capital, Additional Tier 1 capital and Tier 2 capital** in Section B of Division A.1(b) of the Form –
 - (a) in respect of a position arising from a securitization exposure of the institution specified in any notice in writing given to it by the Monetary Authority under section 43(1)(f), by deducting the position from the institution's Common Equity Tier 1 capital; and
 - (b) in respect of other positions, by applying the **pre-amend CI of Form MA(BS)3(IIIId)**.

⁶ Please see section 271(a) of the **pre-amended Rules** for the meaning of K_{IRB} .

The figures reported in Column (c) of items 1 and 2 of Section B of Division A.1(b) should also be reported respectively in items (f)(ix) and (f)(x) of Part II(a) of Form MA(BS)3(II).

B.1.1.3 Division A.1(c) of Form MA(BS)3(IV) - Correlation trading portfolio
(Applicable to AIs adopting the STM approach or (where applicable) the IMM approach)

43. A reporting institution that uses-

- (a) the STM approach to calculate its market risk in respect of specific risk for its exposures in a correlation trading portfolio; or
- (b) the IMM approach to calculate its market risk in respect of specific risk for its interest rate exposures but do not have the MA's approval to calculate the comprehensive risk charge for its exposures in a correlation trading portfolio under the IMM approach,

is required to report in Division A.1(c) of the Form the market risk capital charge for specific risk for its trading book positions (whether long or short) in a correlation trading portfolio. The qualifying criteria for including an institution's trading book positions in a correlation trading portfolio are set out in the definition of the same in section 281 of the Rules.

44. For the reporting of positions in a correlation trading portfolio and the associated market risk capital charge for specific risk in Division A.1(c) of the Form, a reporting institution should -

- (a) apply section 287A of the Rules in respect of positions (whether long or short) in securitization exposures that fall within paragraph (a) of the definition of correlation trading portfolio in section 281 of the Rules, and adhere to section B.1.1.2 of the completion instructions (as a reminder, the market risk capital charge for specific risk for positions in securitization exposures that are subject to the IRB(S) approach attract a scaling factor of 1.06 – see paragraph 39(f));
- (b) apply section 287 and Division 10 of the Rules in respect of positions (whether long or short) in nth-to-default credit derivative contracts that fall within paragraph (a) of the definition of correlation trading portfolio in section 281 of the Rules, and adhere to section B.1.1.4 of the completion instructions; and
- (c) apply section 287 of the Rules in respect of positions (whether long or short) that fall within paragraph (b) of the definition of correlation trading portfolio in section 281 of the Rules, and adhere to section B.1.1.1 of the completion instructions.

45. A reporting institution should report its total long positions and total short positions in its correlation trading portfolio in columns (1) and (2) respectively, and the associated aggregate market risk capital charge for specific risk for those long positions and that

for those short positions in columns (3) and (4) respectively, of Division A.1(c) of the Form.

46. A reporting institution should not offset positions or the market risk capital charge for specific risk for its positions in a correlation trading portfolio except as specified in the applicable completion instructions set out in section B.1.1.1, B.1.1.2 or B.1.1.4, as the case may be.
47. The higher of the total market risk capital charge for specific risk that applies to the long positions or the total market risk capital charge for specific risk that applies to the short positions, as calculated in accordance with paragraphs 44 to 46 above, should be reported in column (5) of Division A.1(c) of the Form.
48. Below is an illustrative example for applying paragraphs 44 to 47 in respect of a correlation trading portfolio -
 - (a) An AI is assumed to hold various positions in a correlation trading portfolio as shown in column 1 of **Table 1A**, and it is further assumed that none of these positions is eligible to be offset for the purposes of calculation of market risk capital charge for specific risk; and
 - (b) The applicable provisions in section 287B for calculating the associated market risk capital charge for specific risk for the positions in the correlation trading portfolio and the assumed resultant capital charges are shown in column 2 (for long positions) or column 3 (for short positions) of the table, while the market risk capital charge for specific risk for the correlation trading portfolio is stated in the last row of the table.

Table 1A: Illustrative example on calculation of market risk capital charge for specific risk for positions in a correlation trading portfolio (“CTP”)

Positions in the CTP	Market risk capital charge for specific risk - long positions	Market risk capital charge for specific risk - short positions
1. Positions in securitization exposures (apply paragraph (a) of the definition of CTP)	\$20 (apply section 287B(1)(a) of the Rules)	\$10 (apply section 287B(1)(a) of the Rules)
2. Positions in n th -to-default credit derivative contracts (apply paragraph (a) of the definition of CTP)	\$40 (apply section 287B(1)(b) of the Rules)	\$30 (apply section 287B(1)(b) of the Rules)
3. Positions for hedging the positions in items 1 and 2 (apply paragraph (b) of the definition of CTP)	\$30 (apply section 287B(1)(c) of the Rules)	\$20 (apply section 287B(1)(c) of the Rules)
Total for the positions above	\$90	\$60
Market risk capital charge for specific risk for the CTP	\$90 (apply section 287B(2) of the Rules)	

B.1.1.4 Division A.1(d) of Form MA(BS)3(IV) – Non-securitization exposures that are nth-to-default credit derivative contracts (excluding those that fall within a correlation trading portfolio) (Applicable to AIs adopting the STM or IMM approach)

49. A reporting institution is required to report in Division A.1(d) of the Form the market risk capital charge for specific risk for its trading book positions (whether long or short) in non-securitization exposures that are nth-to-default credit derivative contracts (excluding those that fall within a correlation trading portfolio). Such positions are referred to as “relevant” specific risk interest rate exposures for the purposes of Division A.1(d).
50. Subject to paragraphs 51 and 52, a reporting institution should follow the completion instructions under section B.1.1.1 for reporting items 1.1 to 1.16 of Division A.1(d) of the Form, except that item 1.16 in this Division is broken down into one row for long positions and one row for short positions.

51. The reporting institution should report in item 1.17 the applicable total market risk capital charge for specific risk for its long and short positions in its relevant specific risk interest rate exposures as:
- (a) during the transitional period (securitization) (i.e. 1 January 2012 to 31 December 2013, both dates inclusive), the *larger* of the total market risk capital charge for specific risk (having applied the maximum possible loss provision in paragraph 20 to individual relevant positions if this treatment is adopted) for the long positions reported in the last column of item 1.16 or the total market risk capital charge for specific risk (having applied the maximum possible loss provision in paragraph 20 to individual relevant positions if this treatment is adopted) for the short positions reported in the last column of item 1.16;
 - (b) after the transitional period (securitization), the *sum* of the total market risk capital charge for specific risk (having applied the maximum possible loss provision in paragraph 20 to individual relevant positions if this treatment is adopted) for each of the positions reported in the last column of item 1.16.
52. For each relevant position in an n^{th} -to-default credit derivative contract or an n^{th} -to-default ***credit-linked note***, irrespective of whether the institution is a protection buyer or a protection seller:
- (a) the market risk capital charge for specific risk for a ***first-to-default credit derivative contract*** or a first-to-default credit-linked note is the lesser of-
 - (i) the sum of the market risk capital charge for specific risk for the individual reference obligations in the basket of reference obligations specified in the contract or note, as the case may be; or
 - (ii) the institution's maximum liability under the contract or the fair value of the note, as the case may be; and
 - (b) the market risk capital charge for specific risk for an n^{th} -to-default credit derivative contract or an n^{th} -to-default credit-linked note, where n is greater than 1, is the lesser of:
 - (i) the sum of the market risk capital charge for specific risk for the individual reference obligations in the basket of reference obligations specified in the contract or note, as the case may be, but disregarding the $(n-1)$ obligation or obligations with the lowest market risk capital charge for specific risk; or
 - (ii) the institution's maximum liability under the contract or the fair value of the note, as the case may be.

B.1.2 Interest rate exposures - general market risk

Construction of maturity ladder

53. A reporting institution should construct a maturity ladder for each currency in which its interest rate exposures are denominated according to the time bands provided in Division A.2 of the Form.
54. The reporting institution should slot all of its long or short positions in debt securities, debt-related derivative contracts, interest rate derivative contracts and interest rate exposures arising from equity-related derivative contracts and commodity-related derivative contracts:
- (a) with a coupon of not less than 3% per annum into a maturity ladder comprising the 13 time bands set out in **Table 2**; and
 - (b) with a coupon of less than 3% per annum into a maturity ladder comprising the 15 time bands set out in **Table 2**.

Table 2: Time bands and risk-weights

Time band	Coupon of not less than 3% per annum	Coupon of less than 3% per annum	Risk-weight
1	≤ 1 month	≤ 1 month	0.00%
2	> 1 to 3 months	> 1 to 3 months	0.20%
3	> 3 to 6 months	> 3 to 6 months	0.40%
4	> 6 to 12 months	> 6 to 12 months	0.70%
5	> 1 to 2 years	> 1.0 to 1.9 years	1.25%
6	> 2 to 3 years	> 1.9 to 2.8 years	1.75%
7	> 3 to 4 years	> 2.8 to 3.6 years	2.25%
8	> 4 to 5 years	> 3.6 to 4.3 years	2.75%
9	> 5 to 7 years	> 4.3 to 5.7 years	3.25%
10	> 7 to 10 years	> 5.7 to 7.3 years	3.75%
11	> 10 to 15 years	> 7.3 to 9.3 years	4.50%
12	> 15 to 20 years	> 9.3 to 10.6 years	5.25%
13	> 20 years	> 10.6 to 12 years	6.00%
14		> 12 to 20 years	8.00%
15		> 20 years	12.50%

55. For the purposes of paragraph 54, the reporting institution should slot fixed rate exposures into the time bands set out in **Table 2** in accordance with their respective residual maturities and slot floating rate exposures into the time bands set out in **Table 2** in accordance with their respective residual terms to the next interest fixing date.
56. The reporting institution should regard interest rate exposures arising from derivative contracts as a combination of the long and short positions in accordance with paragraphs 57 to 60 and slot such positions into the time bands set out in **Table 2**.

57. Interest rate *futures contracts*, interest rate *forward contracts* and forward rate agreements are treated as a combination of the long and short positions in a zero-coupon *specific risk-free security* whereby:
- (a) a long or short position in an interest rate futures contract or interest rate forward contract is to be regarded as:
 - (i) a short or long position respectively with a maturity being the remaining period up to and including the delivery date of the underlying interest rate contract; and
 - (ii) a long or short position respectively with a maturity being the remaining period up to and including the delivery date of the underlying interest rate contract plus the contract period of the underlying interest rate contract. For example, a long position in a June three-month interest rate futures contract taken in December is to be reported at the end of December as a long position in a zero-coupon specific risk-free security in that particular currency with a maturity of nine months and a short position in a zero-coupon specific risk-free security with a maturity of six months (see example (5) in **Annex IV-B**); or
 - (b) a sold or purchased forward rate agreement is to be regarded as:
 - (i) a short or long position respectively with a maturity being the remaining period up to and including the settlement date of the agreement; and
 - (ii) a long or short position respectively with a maturity being the remaining period up to and including the settlement date of the agreement plus the contract period of the agreement.
58. **Bond** futures contracts and bond forward contracts are treated as a combination of the long and short positions in a zero-coupon specific risk-free security and the underlying bond whereby a long or short position in a bond futures contract or bond forward contract is to be regarded as:
- (a) a short or long position respectively in a zero-coupon specific risk-free security with a maturity being the remaining period up to and including the delivery date of the underlying bond; and
 - (b) a long or short position respectively in the underlying bond with a maturity being the remaining period up to and including the delivery date of the underlying bond plus the tenor of the underlying bond.
59. Forward foreign exchange contracts in the trading book are regarded as a long and a short position in a zero-coupon specific risk-free security of two different currencies with the same maturity as forward contracts (see example (8) in **Annex IV-B**).

60. Interest rate *swap contracts* under which a reporting institution receives or pays floating rate interest and pays or receives respectively fixed rate interest are to be regarded as:
- (a) a short or long position respectively in a fixed rate instrument with a maturity being the remaining period up to and including the maturity date of the swap contract concerned ; and
 - (b) a long or short position respectively in a floating rate instrument with a maturity being the remaining period up to and including the next interest fixing date (see example (4) in **Annex IV-B**).

For swap contracts that pay or receive fixed or floating rate interest against some other reference price (e.g. an equity price), the interest rate leg should be slotted into the time bands of Division A.2 of the Form according to the residual terms to the next interest fixing date, with the equity leg being included in the equity framework set out in Division B of the Form. The separate legs of cross-currency swap contracts should be slotted in the relevant maturity ladders for the currencies concerned.

61. In calculating the market risk capital charge for general market risk, the reporting institution may exclude from the maturity ladder long and short positions in identical instruments. The institution may fully offset the *matched positions* in a futures contract or forward contract and the *underlying exposure* of the futures contract or forward contract, as the case may be, except that the position in a zero-coupon specific risk-free security should be included in the calculation of the institution's market risk capital charge for general market risk. For example, if a reporting institution has a long position in a bond and sells the bond in a futures contract or forward contract as at the reporting date, the long and short positions in the bond can be offset but a long position in a zero-coupon specific risk-free security with a maturity being the remaining period up to and including the delivery date of the underlying bond of the futures contract or forward contract should be reported based on the fair value of the bond.
62. In the case of a futures contract or forward contract comprising a range of deliverable bonds, a reporting institution may only offset positions in the contract and the underlying bond which is readily identifiable as the most profitable for the institution with a short position to deliver (i.e. the cheapest to deliver). This means that offsetting is only permitted between a short futures contract or forward contract and a long bond (i.e. not between a long futures contract or forward contract and a short bond) and the bond should be the "cheapest to deliver" bond among the range of deliverable bonds under the contract. The amount to be reported for the remaining long position of the contract, up to and including the delivery date of the contract, should be the face value of the contract divided by the *conversion factor* applicable to the contract and multiplied by the current market price of that bond as determined in accordance with section 4A of the Rules as if measured at fair value. For example, a short position in a futures contract on a five-year fixed rate bond with delivery three months from the reporting date is to be reported as a short position in a 5.25 year bond (i.e. a specific bond which is within the range of deliverable bonds under the futures contract) and a long position in a three-month zero-coupon specific risk-free security. The amount to be reported for both legs is the contract face value divided by the

conversion factor applicable to the contract and multiplied by the current market price of the selected deliverable bond (see example (3) in **Annex IV-B**).

63. A reporting institution may treat opposite positions in the same type of derivative contracts (including the *delta-weighted position* of option contracts calculated according to section B.5) as matched and may fully offset them. For this purpose, positions in the same type of derivative contracts are opposite only if:
- (a) the positions relate to derivative contracts with the same underlying exposures, are of the same nominal value and denominated in the same currency;
 - (b) in the case of futures contracts, the offsetting positions in the underlying interest rate exposures to which the futures contracts relate are for identical exposures and mature within 7 days of each other;
 - (c) in the case of swap contracts and forward rate agreements, the rates (for floating rate positions) of the contracts or agreements, as the case may be, are identical and the coupons are within 15 basis points; and
 - (d) in the case of swap contracts, forward rate agreements and forward contracts, the next interest fixing date or, for fixed coupon positions or forward contracts, the residual maturity, corresponds within the following limits:
 - (i) if either of the contracts or agreements, as the case may be, to be offset has an interest fixing date or residual maturity of not more than one month, the interest fixing date or residual maturity, as the case may be, is the same for both contracts or agreements, as the case may be;
 - (ii) if either of the contracts or agreements, as the case may be, to be offset has an interest fixing date or residual maturity of more than one month but not more than one year, the interest fixing dates or residual maturities, as the case may be, are within 7 days of each other; and
 - (iii) if either of the contracts or agreements, as the case may be, to be offset has an interest fixing date or residual maturity of more than one year, the interest fixing dates or residual maturities, as the case may be, are within 30 days of each other.

For example, a bought and a sold forward rate agreement in the same currency with the same face value, settlement date and deposit maturity date may be offset against each other and excluded from reporting if the contract rates are within 15 basis points of each other. Similarly, opposite swap contracts may be offset if, say, the floating rate in both cases is six month HIBOR and the fixed rates are within 15 basis points of each other. The positions may also be offset if the reference dates (i.e. the residual term to the next interest fixing date or the residual maturity of each contract) of the opposite positions are different but within the range set out in item (d) above. Opposite bond futures contracts may be offset against each other if the deliverable bonds are of the same type and mature within 7 days of each other.

Calculation of market risk capital charge for general market risk

64. A reporting institution should calculate the market risk capital charge for general market risk by:
- (a) multiplying its long and short positions in interest rate exposures in each time band within the maturity ladder by the appropriate risk-weight as set out in Division A.2 of the Form;
 - (b) offsetting the total risk-weighted long and short positions in each time band to produce a single net risk-weighted long or short position for each time band;
 - (c) applying a market risk capital charge factor of 10% on the matched position (being the lesser of the absolute values of the total risk-weighted long and short positions) of each time band, whether long or short, to arrive at a market risk capital charge for each matched position (referred to as “vertical disallowance”). For example, if the sum of the total risk-weighted long position in a time band is \$100 million and the sum of the total risk-weighted short position in the same time band is \$90 million, the vertical disallowance would be 10% of \$90 million (i.e. \$9 million). The \$9 million will be included in the calculation of market risk capital charge for general market risk;
 - (d) subject to paragraph 65:
 - (i) first conducting a round of horizontal offsetting between the net risk-weighted positions for the time bands in each of the 3 zones subject to a scale of market risk capital charge factors, expressed as a percentage of the matched positions for each zone, as set out in **Table 3**;
 - (ii) then conducting a round of horizontal offsetting between the total net risk-weighted positions for the zones across the 3 zones (being between adjacent zones and between zone 1 and zone 3) subject to a scale of market risk capital charge factors, expressed as a percentage of the matched positions between the zones, as set out in **Table 3**,

to arrive at a market risk capital charge for each matched position (referred to as “horizontal disallowance”); and
 - (e) applying a market risk capital charge factor of 100% on the remaining net risk-weighted long or short position in interest rate exposures after carrying out the offsetting in accordance with items (b) and (d) above.

Table 3: Horizontal disallowance

	Time band		Market risk capital charge factor		
Zone	Coupon of not less than 3% per annum	Coupon of less than 3% per annum	Within the zone	Between adjacent zones	Between zones 1 and 3
Zone 1	≤ 1 month	≤ 1 month	40%	40%	100%
	> 1 to 3 months	> 1 to 3 months			
	> 3 to 6 months	> 3 to 6 months			
	> 6 to 12 months	> 6 to 12 months			
Zone 2	> 1 to 2 years	> 1.0 to 1.9 years	30%		
	> 2 to 3 years	> 1.9 to 2.8 years			
	> 3 to 4 years	> 2.8 to 3.6 years			
Zone 3	> 4 to 5 years	> 3.6 to 4.3 years	30%		
	> 5 to 7 years	> 4.3 to 5.7 years			
	> 7 to 10 years	> 5.7 to 7.3 years			
	> 10 to 15 years	> 7.3 to 9.3 years			
	> 15 to 20 years	> 9.3 to 10.6 years			
	> 20 years	> 10.6 to 12 years			
		> 12 to 20 years			
		> 20 years			

65. For the purposes of:

- (a) a reporting institution conducting the first round of horizontal offsetting under paragraph 64(d)(i), the institution should:
 - (i) calculate the net risk-weighted long or short position of each time band after separately adding long positions to long positions and short positions to short positions;
 - (ii) in the case of long and short positions in the same zone, subject the matched position (being the lesser of the absolute values of the total net risk-weighted long and short positions for the zone) to a market risk capital charge factor of 40% for zone 1 and 30% for zone 2 and zone 3; and
 - (iii) offset the positions of time bands within the same zone to create the matched position to which the market risk capital charge factor is applied under item (ii) above and a total net risk-weighted long or short position for each zone;
- (b) a reporting institution conducting the second round of horizontal offsetting under paragraph 64(d)(ii), the institution should:
 - (i) in the case of opposite positions between adjacent zones (being one zone having a total net risk-weighted long position while another zone having a total net risk-weighted short position), subject the matched

position (being the lesser of the absolute values of the total net risk-weighted long position in one zone and the total net risk-weighted short position in another zone) to a market risk capital charge factor of 40%;

- (ii) offset the positions between adjacent zones to create the matched position to which the market risk capital charge factor is applied under item (i) above and a total net risk-weighted long or short position;
- (iii) subject to item (iv) below, in the case of opposite positions between zone 1 and zone 3, subject the matched position (being the lesser of the absolute values of the total net risk-weighted long or short position in zone 1 and the total net risk-weighted short or long position respectively in zone 3) to a market risk capital charge factor of 100%; and
- (iv) in order to calculate the horizontal disallowance between zone 1 and zone 3 for item (iii) above:
 - (A) if the total net risk-weighted positions of zone 1 and zone 2 are netted, treat the net position as the remaining position of zone 1;
 - (B) if the total net risk-weighted positions of zone 2 and zone 3 are netted, treat the net position as the remaining position of zone 3.

66. A reporting institution should derive the market risk capital charge for general market risk for its portfolio of interest rate exposures by aggregating:

- (a) the total market risk capital charge for vertical disallowance for all time bands calculated in accordance with paragraph 64(c);
- (b) the total market risk capital charge for horizontal disallowance for individual zones and across different zones calculated in accordance with paragraph 64(d); and
- (c) the market risk capital charge for the remaining net risk-weighted long or short position calculated in accordance with paragraph 64(e).

See **Annex IV-C** for a numerical illustration of the composition of the market risk capital charge for general market risk for interest rate exposures.

67. A reporting institution should calculate the market risk capital charge for general market risk for each currency separately, convert each amount so calculated into HKD at current market rates and then aggregate the amounts so calculated. In other words, a reporting institution should use separate forms to report the positions in HKD for different currencies in Division A.2 of the Form.

Other alternative methods

68. A reporting institution should use the above methodology to calculate its positions to be included in the maturity ladder unless it has the prior consent of the MA to use a different methodology. For example, a reporting institution with a large portfolio of swap contracts may, subject to the MA's prior consent, use an alternative methodology to calculate the position of these contracts to be included in the maturity ladder. One method is to first convert the payments required by the swap contract into the present values. For this purpose, each payment should be discounted using zero-coupon yields and a single net figure for the present value of the cash flows should be entered into the appropriate time band of the maturity ladder.
69. A reporting institution should use the **maturity method** set out in paragraphs 53 to 67 to calculate the market risk capital charge for general market risk for its portfolio of interest rate exposures unless it has the prior consent of the MA to use a different method such as the duration method. The duration method is set out in paragraph 718(vii) of "International Convergence of Capital Measurement and Capital Standards: A Revised Framework (Comprehensive Version)" issued by the Basel Committee on Banking Supervision in June 2006. A reporting institution wishing to use this method should possess the necessary capability to calculate the duration and price sensitivity of each position separately.

B.2 Equity Exposures (Trading Book)

70. This subsection describes the framework for calculating the market risk capital charge for a reporting institution's equity exposures booked in the trading book. The calculation treatment of equity exposures relating to option contracts is separately described in section B.5.
71. A reporting institution should, for the purposes of calculating the market risk capital charge for its trading book positions (whether long or short) in equities and equity-related derivative contracts:
- (a) calculate the market risk capital charge for specific risk for each of those positions; and
 - (b) calculate the market risk capital charge for general market risk for those positions.
72. For the purpose of paragraph 71, a reporting institution should report in Division B of the Form each of its positions in equities and equity-related derivative contracts for each exchange where the equities or, in the case of equity-related derivative contracts, the underlying equities concerned, are listed or traded (i.e. on an exchange-by-exchange basis). In other words, the positions should be reported under separate columns according to where the equities concerned are listed or traded. For overseas markets, a reporting institution should indicate the **country** where the exchange is located in the space provided. If an equity is listed on more than one exchange, it should be reported in the exchange of its primary listing.

73. A reporting institution should convert its equity-related derivative contracts into positions in the underlying equity by:
- (a) valuing its futures contracts and forward contracts relating to an individual equity at the fair value of the underlying equity;
 - (b) valuing its futures contracts relating to equity indices as the current index value multiplied by the monetary value of one index point set by the futures exchange where the futures contract is traded (i.e. the “tick” value, e.g. the Hang Seng Index Future is HK\$50 per point) or the fair value of the underlying basket of equities used to compile the index (see example (11) in **Annex IV-B**).
74. A reporting institution should regard each of its equity swap contracts as long and short positions such that:
- (a) in the case of an equity swap contract in which the institution:
 - (i) is receiving an amount based on the change in value of a particular equity or equity index; and
 - (ii) is paying an amount based on the change in value of a different equity or equity index,the position in item (i) above is the long position and the position in item (ii) above is the short position, of the equity swap contract; and
 - (b) in the case of an equity swap contract which involves a position requiring the receipt or payment of fixed or floating rate interest, the institution treats the position under the maturity method and reports in Division A.2 of the Form according to the instructions set out in section B.1.2.
75. If equities are to be received or delivered under a forward contract, the institution should treat any interest rate exposure arising out of the contract under the maturity method and report in Division A.2 of the Form according to the instructions set out in section B.1.2. A reporting institution should also treat any interest rate exposure arising out of an equity futures contract or any equity index futures contract under the maturity method and report in Division A.2 of the Form according to the instructions set out in section B.1.2.
76. A reporting institution may fully offset its matched positions in each identical equity or equity index with the same delivery month in each exchange in order to produce a single net long or short position. A futures contract in a given equity can also be offset against an opposite position in the same equity. However, in these two cases, the market risk capital charge for general market risk for any interest rate exposure arising out of such contracts should be calculated under the maturity method and reported in Division A.2 of the Form. For example, a short futures contract on an equity with delivery 3 months from the reporting date can be offset against a long position in the underlying equity. However, the interest rate exposure arising out of the equity futures contract should be reported as a long position in a three-month zero-

coupon specific risk-free security at the fair value of the equity denominated in the same currency as the equity.

77. A reporting institution should calculate the market risk capital charge for specific risk for the institution's trading book positions in equities and equity-related derivative contracts as 8% of its total gross (long plus short) position. The institution should also calculate the market risk capital charge for general market risk for the institution's trading book positions in equities and equity-related derivative contracts as 8% of its total net position in equities and equity-related derivative contracts (being the difference between the sum of the institution's long positions and the sum of the institution's short positions). The institution should not offset net long and short positions on different exchanges.

B.3 Foreign Exchange Exposures

78. This subsection describes the framework for calculating the market risk capital charge for a reporting institution's foreign exchange exposures (including gold). The calculation treatment of foreign exchange exposures relating to option contracts is separately described in section B.5.
79. A reporting institution should, for the purposes of calculating the market risk capital charge for its positions in foreign exchange (including gold) and exchange rate-related derivative contracts, determine the amount of its net open position (being the sum of the net spot position and the net forward position) in each currency and in gold. Subject to any applicable adjustments specified in paragraphs 6(b), 80 and 81, the amounts should be based on the sum of the figures reported under, where applicable, columns 5 (Hong Kong office), 7 (overseas branches) and 8 (subsidiaries) of Part I of the Return of Foreign Currency Position (Form MA(BS)6), but reported in thousand Hong Kong dollars. The institution should convert each amount into HKD at current market rates for reporting purposes. Positions arising from foreign currency option contracts should be reported for each currency, subject to the instructions set out in section B.5.
80. Where a reporting institution has reported positions in "structural assets (liabilities)" in column 6 or 10 of Part I of the Return of Foreign Currency Position (Form MA(BS)6), the reported figures should be added to those reported under, where applicable, columns 5, 7 and 8 of Part I of the same Return for the purposes of determining the amount of the institution's net open position in each currency and in gold as mentioned in paragraph 79 above.
81. Where a reporting institution has maintained *structural positions* for regulatory capital purposes, the institution should not exclude any of such structural positions from the calculation of market risk capital charge for its foreign exchange exposures except after consultation with the MA. In this regard, "structural position" means a position in foreign exchange held by the institution with the intention of hedging any adverse effect of exchange rate movements on its capital adequacy ratio.
82. The "sum of net long/short positions" of a reporting institution is the sum of:

- (a) its total net long or net short position in each foreign currency (including gold and, if applicable, the net delta-weighted position of option contracts in each such currency); and
 - (b) its “HKD position”, which is a balancing figure to ensure that the total of all net long positions for all currencies is the same as the total of all net short positions for all currencies.
- 83. The “USD/HKD position” of the reporting institution is:
 - (a) zero if the institution’s net open positions in USD and HKD are both long or both short;
 - (b) the smaller of the 2 positions (expressed as the absolute value) if the institution’s net open positions in USD and HKD are opposite positions.
- 84. The “adjusted sum of net long/short positions” of the reporting institution is equal to the “sum of net long/short positions” less its “USD/HKD position”.
- 85. The reporting institution’s “total net open position” is derived by aggregating:
 - (a) its “adjusted sum of net long/short positions; and
 - (b) the institution’s net position in gold (whether long or short).
- 86. The market risk capital charge for the reporting institution’s positions in foreign exchange (including gold) is 8% of its “total net open position”.

B.4 Commodity Exposures

- 87. This subsection describes the framework for calculating the market risk capital charge for a reporting institution’s commodity exposures. The calculation treatment of commodity exposures relating to option contracts is separately described in section B.5.
- 88. Long and short positions in commodities should be reported in Division D of the Form by the nature of items. A reporting institution should, for the purposes of calculating the market risk capital charge for its positions in commodities and commodity-related derivative contracts, convert its gross (long plus short) position in each commodity to which those positions relate (measured in barrels, kilograms or grams or such other standard unit of measurement as is applicable to the commodity concerned) into monetary terms at **current market price** of the commodity.
- 89. A futures contract or forward contract relating to a commodity should be valued by reference to the notional amount of the standard unit of measurement of the commodity converted into monetary terms at current market price. Any interest rate exposure arising out of such commodity-related futures contract or forward contract should be dealt with under the maturity method and reported in Division A.2 of the Form according to the instructions set out in section B.1.2.

90. In the case of a commodity swap contract under which one leg of the swap contract relates to a position or series of positions referenced to a fixed price and the other leg of the swap contract relates to a position or series of positions referenced to the current market price of a reference commodity or commodities, a reporting institution should, for each payment under the swap contract, value each of the positions at the notional amount of the swap contract. The institution should also treat each such position as long if the institution is paying at a fixed price and receiving at a floating market price and short if the institution is receiving at a fixed price and paying at a floating market price. If one of the legs of the swap contract involves receiving or paying at a fixed or floating interest rate, that leg should be treated under the maturity method and reported in Division A.2 of the Form according to the instructions set out in section B.1.2.
91. A reporting institution may offset long and short positions in the same commodity when calculating its open positions. Offsetting is, however, not allowed for positions in different types of commodities.
92. A reporting institution should calculate the market risk capital charge for its commodity exposures as the sum of 15% of the institution's net position in each commodity to cover the risk of a change in the market price of the commodity and 3% of the institution's gross (long plus short) position in each commodity to cover:
- (a) the risk that the relationship between the prices of similar commodities changes over time;
 - (b) the risk of a change in the cost of carry for forward positions and option contracts; and
 - (c) the risk that the forward price may change for reasons other than a change in interest rates.

B.5 Option Exposures

93. A reporting institution should, for the purposes of calculating the market risk capital charge for its option exposures to debt securities, interest rates, equities, foreign exchange (including gold) and commodities, use either the **simplified approach** or the **delta-plus approach**. A reporting institution should seek the prior consent of the MA if it wishes to adopt any approach other than the simplified approach or the delta-plus approach.

B.5.1 Simplified approach

94. A reporting institution should not use the simplified approach to calculate the market risk capital charge for its option exposures unless the institution:
- (a) purchases option contracts but does not write option contracts; or

- (b) purchases option contracts and only writes option contracts that are fully hedged by matched long positions in the same option contracts.

The institution should exclude from the calculation the option contracts written by it and the corresponding purchased option contracts fully hedged by such written option contracts. Only its outstanding purchased option contracts should be used for the calculation of the market risk capital charge under the simplified approach.

- 95. A reporting institution's positions in the outstanding purchased option contracts and the related underlying exposures of those option contracts are not subject to the calculation methodologies set out in sections B.1 to B.4. These positions are "carved-out" and reported in Division E.1 of the Form, subject to separately calculated market risk capital charges that incorporate both specific risk and general market risk.
- 96. A reporting institution should, for the purposes of calculating the market risk capital charge for its outstanding purchased option contracts (with or without related positions in the underlying exposures of those option contracts):

- (a) where the institution has:
 - (i) a long position in a put option contract and a long position in the underlying exposure of the put option contract; or
 - (ii) a long position in a call option contract and a short position in the underlying exposure of the call option contract,

multiply the fair value of the position in the underlying exposure of the option contract by the sum of the market risk capital charge factors for general market risk and specific risk for the position in the underlying exposure of such option contract as set out in **Table 4** less the amount by which the option contract is in-the-money (if any). For example, if a reporting institution holding 100 shares currently valued at \$10 each holds an equivalent put option contract with a strike price of \$11, the market risk capital charge will be: $\$1,000 \times 16\%$ (8% specific risk plus 8% general market risk) = \$160, less the amount by which the option contract is in-the-money $(\$11 - \$10) \times 100 = \$100$, that is, \$60. Where the amount derived from the calculation is negative, the institution should treat the market risk capital charge for the relevant outstanding purchased option contract and the position in the underlying exposure of such option contract as zero;

- (b) where the institution has a long position in a call option contract or a long position in a put option contract, use the lesser of:
 - (i) the fair value of the underlying exposure of the option contract multiplied by the sum of the market risk capital charge factors for general market risk and specific risk for the underlying exposure of such option contract as set out in **Table 4**; and
 - (ii) the fair value of the option contract; and

- (c) calculate in a way such that:
- (i) the market risk capital charge is calculated separately for individual option contracts but together with the related position in the underlying exposure of such option contracts;
 - (ii) the institution uses the sum of the market risk capital charge for individual option contracts to calculate the total market risk capital charge for its portfolio of option exposures.

Table 4: Market risk capital charge factor for each risk category

Risk category	Market risk capital charge factor for specific risk	Market risk capital charge factor for general market risk
Interest rate	As per the market risk capital charge factors for specific risk set out in <u>Table 1</u> according to the class, credit quality grade and residual maturity	As per the risk-weights set out in <u>Table 2</u> according to the residual maturity for fixed rate exposures or residual term to next interest fixing date for floating rate exposures and coupon rate
Equity	8.00%	8.00%
Foreign exchange	0.00%	8.00%
Commodity	0.00%	15.00%

97. If it is unclear to a reporting institution which side of an option contract purchased by it constitutes the underlying exposure, the institution should take the exposure which would be received by it if the option under the contract were exercised to be the underlying exposure. In addition, the nominal value should be used for option contracts where the market value of the underlying exposure could be zero, e.g. caps and floors, swaption contracts, etc.
98. For the purposes of calculating the market risk capital charge for an option contract purchased by the institution which has a residual maturity of more than 6 months, the strike price of the option contract should be compared with the forward price (i.e. not the current market price) of the underlying exposure of the option contract. If it is not practical for the institution to do so, it should take the amount by which the option contract is considered to be in-the-money as zero.

B.5.2 Delta-plus approach

99. A reporting institution which writes option contracts (other than a reporting institution using the simplified approach) should adopt the delta-plus approach and incorporate

the delta-weighted positions of its outstanding option contracts into their respective risk categories, i.e. reported in Divisions A to D of the Form. Such delta-weighted option positions should be subject to:

- (a) the market risk capital charge for general market risk and specific risk for *delta* risk;
- (b) the market risk capital charge for *gamma* risk; and
- (c) the market risk capital charge for *vega* risk.

Delta risk

- 100. A reporting institution should, for the purposes of calculating its delta risk, slot its delta-weighted positions which have debt securities or interest rates as the underlying exposures of the relevant option contracts into the time bands set out in **Table 2**.
- 101. Interest rate option contracts should be regarded as long and short positions such that one position is referenced to the time the option contract concerned takes effect and the other position is referenced to the time that option contract matures. For example:
 - (a) a purchased call option contract on a June three-month interest rate futures contract is to be reported in March, on the basis of its delta-weighted position, as a long position in a six-month zero-coupon specific risk-free security and a short position in a three-month zero-coupon specific risk-free security. A written option contract should similarly be reported as a long position in a three-month zero-coupon specific risk-free security and a short position in a six-month zero-coupon specific risk-free security;
 - (b) a two-month purchased call option contract on a bond futures contract where delivery of the five-year bond takes place in September is to be reported in March as a long position in a 5 1/2 year bond and a short position in a six-month zero-coupon specific risk-free security, both positions being delta-weighted; and
 - (c) floating rate instruments with caps or floors are to be reported as a combination of floating rate securities and a series of European-style option contracts. For example, the holder of a two-year floating rate bond indexed to six month LIBOR with a cap of 8% should be reported as:
 - (i) a bond that reprices in six months; and
 - (ii) a series of three written call option contracts on a forward rate agreement with a reference rate of 8%, each with a negative sign at the time the underlying agreement takes effect and a positive sign at the time the underlying agreement matures. The instructions applying to closely matched positions set out in paragraph 63 should also apply (see example (7) in **Annex IV-B**).

102. A reporting institution should calculate the market risk capital charge for its option contracts with equities or equity indices as the underlying exposure by applying the calculation treatment set out in section B.2 to the delta-weighted positions of those option contracts. For this purpose, equities or equity indices on each exchange should be treated as a separate underlying exposure.
103. A reporting institution should calculate the market risk capital charge for its option contracts with foreign exchange or gold as the underlying exposure by applying the calculation treatment set out in section B.3 to the net delta-weighted positions (being the difference between the institution's total delta-weighted long positions and its total delta-weighted short positions) of those option contracts.
104. A reporting institution should calculate the market risk capital charge for its option contracts with commodities as the underlying exposure by applying the calculation treatment set out in section B.4 to the delta-weighted positions of those option contracts.
105. To sum up, the calculation treatment of the delta-weighted option positions should be the same as those for the positions in the underlying exposures of the option contracts as described in sections B.1 to B.4, except that the value of the underlying exposures should be adjusted by the delta of the relevant option contracts.

Gamma risk

106. Market risk capital charges for gamma risk should be reported in Division E.2 of the Form.
107. A reporting institution should calculate the gamma impact of each of its option contracts by using the following formula:

$$\text{Gamma impact} = \frac{1}{2} \times \text{Gamma} \times \text{VU}^2$$

where VU = variation of the underlying exposure of the option contract

108. VU should be calculated as:
- (a) for option contracts relating to debt securities, debt security indices and interest rates, the fair value of that underlying exposure multiplied by the risk-weight for the appropriate time band set out in **Table 2**;
 - (b) for option contracts relating to equities and equity indices, the fair value of that underlying exposure multiplied by 8%;
 - (c) for option contracts relating to foreign exchange (including gold), the fair value of that underlying exposure multiplied by 8%; and
 - (d) for option contracts relating to commodities, the fair value of that underlying exposure multiplied by 15%.

109. For the purposes of paragraph 108, a reporting institution should treat the following positions as the same underlying exposure:
- (a) for interest rate exposures, positions within each time band as set out in **Table 2**;
 - (b) for equities and equity indices exposures, positions on each exchange;
 - (c) for foreign exchange and gold exposures, positions in each currency pair and gold; and
 - (d) for commodity exposures, positions in each commodity.

A reporting institution with option positions relating to more underlying exposures than the space provided in Division E.2 of the Form should report its positions in additional forms.

110. Each option contract on the same underlying exposure should have a gamma impact that is either positive or negative. These individual gamma impacts should be offset to produce a positive or negative net gamma impact for that exposure. Only those negative net gamma impacts are reported in Division E.2 of the Form and included in the calculation of the reporting institution's market risk capital charge for gamma risk. The total market risk capital charge for gamma risk is the sum of the absolute value of the negative net gamma impacts.

Vega risk

111. Market risk capital charges for vega risk should be reported in Division E.2 of the Form. A reporting institution should calculate the market risk capital charge for vega risk by multiplying the sum of the vegas for all of its option contracts on the same underlying exposure as defined in paragraph 108 by a proportional shift of 25% in the volatility of the value of the underlying exposures of those option contracts. For example, an increase of volatility in the value of the underlying exposure of an option contract carries a risk of loss for a short position in such option contract. Assuming the current volatility of the underlying exposure of the option contract at 20%, a proportional shift of 25% in the volatility means that the vega of the option contract has to be calculated on the basis of an increase in volatility of 5 percentage points from 20% to 25%. If the vega of an option contract is calculated as 1.68, i.e. a 1% increase in volatility increases the value of the option contract by 1.68, the change in volatility of 5 percentage points should increase the value of the option contract by 8.4 (1.68 x 5) which represents the market risk capital charge for vega risk to be reported in Division E.2 of the Form.
112. The total market risk capital charge for vega risk is the sum of the absolute value of the individual market risk capital charges for vega risk.

Section C: IMM Approach to the Calculation of Market Risk

113. A reporting institution which has been approved by the MA to use the IMM approach to calculate its market risk is required to complete Division F and, where applicable, Division A1(b), (c) or (d) (see paragraph 114), of the Form. This section covers the reporting of regulatory capital for market risk under Division F of the Form using the IMM approach.
114. Even if a reporting institution has the MA's approval to calculate the specific risk charge for interest rate exposures using the IMM approach, the institution must nevertheless apply the STM approach to calculate the market risk capital charge for specific risk for its trading book positions (whether long or short) in:
- (a) nth-to-default credit derivative contracts which fall within section 286(a)(iv) of the Rules (please refer to section B.1.1.4 for the applicable instructions);
 - (b) securitization exposures which fall within section 286(a)(ii) of the Rules (please refer to section B.1.1.2 for the applicable instructions); and
 - (c) exposures which fall within section 286(a)(iii) of the Rules (i.e. correlation trading portfolio) but for which the institution does not have the approval of the MA to calculate a comprehensive risk charge under the IMM approach (please refer to section B.1.1.3 for the applicable instructions).
115. Subject to paragraphs 116 and 117, a reporting institution should calculate the risk-weighted amount for market risk as the sum of:
- (a) the market risk capital charge for general market risk calculated by the institution's *internal model(s)* expressed as *VaR* and *stressed VaR*;
 - (b) where applicable, the market risk capital charge for specific risk for interest rate exposures and equity exposures calculated by the institution's internal model(s) expressed as VaR, stressed VaR, incremental risk charge and/or *comprehensive risk charge*; and
 - (c) where applicable, the supplemental capital charge referred to in section 318(3) of the Rules in respect of a correlation trading portfolio,
- multiplied by 12.5.
116. A reporting institution may have a portfolio of its market risk positions which fall within a risk category (the relevant portfolio) excluded from its market risk calculation under the IMM approach if the institution is granted an exemption by the MA under section 23A(2)(a) of the Rules. A reporting institution to which such an exemption is granted should use the STM approach to calculate its market risk for the relevant portfolio to which the exemption relates.
117. For the purposes of calculating the market risk capital charge for its positions in foreign exchange (including gold) and exchange rate-related derivative contracts, a reporting institution should not exclude any of its structural positions from such

calculation except after consultation with the MA. In this regard, “structural position” means a position in foreign exchange held by the institution with the intention of hedging any adverse effect of exchange rate movements on its capital adequacy ratios.

C.1. Market risk capital charge calculated by internal models

C.1.1. Division F.1(a) of Form MA(BS)3(IV) - Market risk capital charge for general market risk : VaR and stressed VaR

118. If a reporting institution uses an internal model to calculate the market risk capital charge for general market risk, the institution should report-
- (a) the VaR and the stressed VaR calculated by the internal model as at the last **trading day** of the reporting quarter in column (a) of Division F.1(a) of the Form (if the stressed VaR as at that day is not available, report the latest available stressed VaR); and
 - (b) the average VaR and the average stressed VaR for the last 60 trading days of the reporting quarter⁷ in column (b) of Division F.1(a) of the Form, both for individual risk categories (i.e. items 1.1 to 1.4 in respect of the VaR, and items 2.1 to 2.4 in respect of the stressed VaR, of Division F.1(a) of the Form) and the aggregate of all risk categories (i.e. item 1.5 in respect of the VaR, and item 2.5 in respect of the stressed VaR, of Division F.1(a) of the Form).
119. For the purposes of calculating a stressed VaR, a reporting institution must, in accordance with section 317(2) of the Rules, obtain the prior consent of the MA for the use of a **stressed VaR relevant period** in respect of any portfolio of exposures included in the calculation, and thereafter regularly review, on at least an annual basis, the appropriateness of such a period.
120. If the MA is satisfied that the reporting institution’s system for identifying and measuring correlations is effective for its purpose and implemented in a prudent manner, recognition of empirical correlations across the risk categories (including related option volatilities in each risk category) is allowed. The VaR or the stressed VaR for the aggregate of all risk categories is not necessarily equal to an arithmetic sum of the VaR or the stressed VaR for individual risk categories because of the correlations across the risk categories.
121. A reporting institution should report in item 1.5(c) of Division F.1(a) of the Form the number of **back-testing exceptions** in relation to the VaR for the last 250 trading days of the reporting quarter (i.e. from the reporting quarter end going backwards) based on the actual daily changes in portfolio value. Similarly, the institution should, where applicable, report in item 1.5(d) of Division F.1(a) of the Form the number of back-

⁷ It is expected that the basis for computing the average stressed VaR, average incremental risk charge or average comprehensive risk charge should be consistent with that of the AI’s computation frequency for the respective market risk capital charge. For instance, if an AI calculates its stressed VaR on a daily basis, then it should calculate a daily average stressed VaR over the last 60 trading days of the reporting quarter; if the AI calculates its stressed VaR on a weekly basis, then a weekly average of the stressed VaR over the specified period should be calculated.

testing exceptions in relation to the VaR for the last 250 trading days of the reporting quarter based on the hypothetical changes in portfolio value that would occur if end-of-day positions remained unchanged during the one day holding period.

122. The multiplication factors, m_c for the VaR and m_s for the stressed VaR, to be reported respectively in items 1.5(e) and 2.5(e) of Division F.1(a) of the Form are separately the sum of:

- (a) the value of 3;
- (b) a plus factor, ranging from zero to one, based on the number of back-testing exceptions in relation only to the VaR (i.e. the larger of item 1.5(c) and item 1.5(d) of Division F.1(a) of the Form) for the last 250 trading days derived from **Table 5** or other considerations which satisfy the MA that the model in use is fundamentally sound and any increase in the back-testing exceptions is temporary; and

Table 5: Plus factors for back-testing exceptions

Zone	Number of back-testing exceptions out of 250 observations	Plus factor
Green zone	Less than 5	0.00
Yellow zone	5	0.40
	6	0.50
	7	0.65
	8	0.75
	9	0.85
Red zone	10 or more	1.00

- (c) any additional plus factor assigned to the institution by the MA. Where the MA is satisfied that the institution has ceased to satisfy any of the requirements specified in Schedule 3 of the Rules applicable to the institution, the MA may assign an additional plus factor to the institution (the value of item 1.5(e) is equal to item 2.5(e) only if the additional plus factor assigned by the MA for calculating m_c is the same as that assigned for calculating m_s).
123. A reporting institution should not, without the prior consent of the MA, make any significant change to the approach it uses to determine the number of back-testing exceptions under paragraph 122(b).
124. A reporting institution should report the market risk capital charge for general market risk calculated by the internal model expressed as VaR in item 1.7 (or that expressed as stressed VaR in item 2.7) of Division F.1(a) of the Form which is the higher of:
- (a) item 1.5(a), i.e. the VaR for the aggregate of all risk categories as at the last trading day of the reporting quarter (or item 2.5(a), i.e. the institution's stressed VaR for the aggregate of all risk categories as at the last trading day of

the reporting quarter (if the stressed VaR as at that day is not available, the latest available stressed VaR)); and

- (b) item 1.6, i.e. the average VaR for the last 60 trading days of the reporting quarter (item 1.5(b)) times the multiplication factor, m_c , in item 1.5(e) (or item 2.6, i.e. the average stressed VaR for the last 60 trading days of the reporting quarter (item 2.5(b)) times the multiplication factor, m_s , in item 2.5(e)).
125. However, if a reporting institution uses a single internal model to calculate the market risk capital charge for both general market risk and specific risk expressed as VaR (or stressed VaR), the institution does not need to report its calculation for general market risk and specific risk separately. In other words, the figures reported in items 1.1 to 1.7 in relation to the VaR (or those in items 2.1 to 2.7 in relation to the stressed VaR) of Division F.1(a) of the Form cover both general market risk and specific risk, and the institution is not required to complete Division F.1(b) of the Form.
126. A reporting institution should report in item 3 of Division F.1(a) of the Form the total market risk capital charge for general market risk calculated by internal models expressed as VaR and stressed VaR, which is equal to the sum of items 1.7 and 2.7 of Division F.1(a) of the Form.

C.1.2. Division F.1(b) of Form MA(BS)3(IV) - Market risk capital charge for specific risk : VaR and stressed VaR

127. If a reporting institution uses one internal model to calculate the market risk capital charge for general market risk and another internal model to calculate the market risk capital charge for specific risk, the institution should report the figures relating to the market risk capital charge for specific risk expressed as VaR and stressed VaR in items 1 and 2 of Division F.1(b) of the Form respectively according to the following instructions:
- (a) report in item 1.1(a) the VaR, and in item 2.1(a) the stressed VaR, for the aggregate of all risk categories (i.e. interest rate exposures and equity exposures) as at the last trading day of the reporting quarter (if the stressed VaR as at that day is not available, report the latest available stressed VaR);
 - (b) report in item 1.1(b) the average VaR, and in item 2.1(b) the average stressed VaR, for the last 60 trading days of the reporting quarter⁷;
 - (c) report in item 1.1(c) the number of back-testing exceptions in relation to the VaR for the last 250 trading days of the reporting quarter based on the actual daily changes in portfolio value;
 - (d) report in item 1.1(d) the number of back-testing exceptions in relation to the VaR for the last 250 trading days of the reporting quarter based on the hypothetical changes in portfolio value that would occur if end-of-day positions remained unchanged during the one day holding period;

- (e) report in items 1.1(e) and 2.1(e) respectively the multiplication factors, m_c for the VaR and m_s for the stressed VaR, which are calculated according to paragraph 122 (item 1.1(e) is equal to item 2.1(e) only if the additional plus factor assigned by the MA for calculating m_c is the same as that assigned for calculating m_s);
 - (f) report in item 1.2 the average VaR for the last 60 trading days of the reporting quarter (item 1.1(b)) times the multiplication factor, m_c (item 1.1(e)) (or report in item 2.2 the average stressed VaR for the last 60 trading days of the reporting quarter (item 2.1(b)) times the multiplication factor, m_s (item 2.1(e))); and
 - (g) report in item 1.3 the market risk capital charge for specific risk expressed as VaR, which is the higher of item 1.1(a) and item 1.2 (or report in item 2.3 the market risk capital charge for specific risk expressed as stressed VaR, which is the higher of item 2.1(a) and item 2.2).
128. For the purposes of calculating stressed VaR, a reporting institution must, in accordance with section 317(2) of the Rules, obtain the prior consent of the MA for the use of a stressed VaR relevant period in respect of any portfolio of exposures included in the calculation, and thereafter regularly review, on at least an annual basis, the appropriateness of such a period.
129. A reporting institution should report in item 3 of Division F.1(b) of the Form the total market risk capital charge for specific risk calculated by internal models expressed as VaR and stressed VaR, which is equal to the sum of items 1.3 and 2.3 of Division F.1(b) of the Form.
130. A reporting institution to which paragraph 114 applies may, in addition to calculating the market risk capital charge for specific risk for the relevant exposures under the STM approach, also apply to the MA to include the institution's interest rate exposures referred to in paragraph 114(a) and (b) in its calculation of the market risk capital charge for specific risk expressed as VaR and stressed VaR under the IMM approach.

C.1.3. Division F.1(c) of Form MA(BS)3(IV) - Market risk capital charge for specific risk : Incremental risk charge, comprehensive risk charge and supplemental capital charge

131. A reporting institution that models specific risk is subject to the market risk capital charge for specific risk expressed as the incremental risk charge and/or comprehensive risk charge in the following circumstances –
- (a) the institution that has the approval of the MA to model specific risk for interest rate exposures should calculate the incremental risk charge for its trading book positions in interest rate exposures that fall within paragraph (a) of the definition of incremental risk charge in section 281 of the Rules. Failure to obtain such an approval means that the institution has to calculate

the market risk capital charge for specific risk for those positions using the STM approach;

- (b) the institution that has the approval of the MA to model specific risk for both interest rate exposures and equity exposures may, at its discretion, choose to seek the MA's approval to calculate the incremental risk charge for its trading book positions in equity exposures that fall within paragraph (b) of the definition of incremental risk charge in section 281 of the Rules; and
- (c) the institution that has the approval of the MA to model specific risk for interest rate exposures may seek the MA's approval to calculate the comprehensive risk charge for its trading book positions in a correlation trading portfolio; otherwise the institution has to calculate the market risk capital charge for specific risk for those positions using the STM approach.

132. A reporting institution should report, where applicable, its incremental risk charge and comprehensive risk charge in Sections 1 and 2 of Division F.1(c) of the Form respectively as follows:

- (a) report the latest available incremental risk charge or comprehensive risk charge calculated by the institution (at least once a week, or more frequently as required by the MA, using the internal model) in the following manner (however, incremental risk charge or comprehensive risk charge calculated as at the last trading day of the reporting quarter is preferred) –
 - (i) the incremental risk charge arising from interest rate exposures and equity exposures are to be reported in items 1.1(a) and 1.2(a) respectively, and the aggregate incremental risk charge in item 1.3(a); and
 - (ii) the comprehensive risk charge for the correlation trading portfolio is to be reported in item 2.1(a);
- (b) similarly report the average incremental risk charge and average comprehensive risk charge for the last 12 weeks of the reporting quarter⁷ in items 1.1(b) to 1.3(b), and in item 2.1(b), of Division F.1(c) of the Form respectively;
- (c) report the scaling factors, S_i for the incremental risk charge in item 1.3(c), and S_c for the comprehensive risk charge in item 2.1(c). The respective scaling factors are to be 1 or such other value as the MA may specify in a notice in writing given to the institution;
- (d) report the incremental risk charge calculated by the internal model in item 1.4 of Division F.1(c) of the Form, which is derived by multiplying the scaling factor, S_i , in item 1.3(c) by the higher of:
 - (i) item 1.3(a), i.e. the institution's aggregate latest available incremental risk charge of the reporting quarter; and

- (ii) item 1.3(b), i.e. the institution's average incremental risk charge for the last 12 weeks of the reporting quarter;
 - (e) report the comprehensive risk charge calculated by the internal model in item 2.2 of Division F.1(c) of the Form, which is derived by multiplying the scaling factor, S_c , in item 2.1(c) by the higher of:
 - (i) item 2.1(a), i.e. the institution's latest available comprehensive risk charge of the reporting quarter; and
 - (ii) item 2.1(b), i.e. the institution's average comprehensive risk charge for the last 12 weeks of the reporting quarter;
 - (f) derive the applicable amount of market risk capital charge for specific risk for the correlation trading portfolio to be reported in item 2.4, for the purpose of which, the institution should -
 - (i) calculate the market risk capital charge for specific risk for each of the long and short positions in its correlation trading portfolio using the STM approach in accordance with the instructions in section B.1.1.3, and report the total market risk capital charge for specific risk for those positions in item 2.3.1 (for long positions) or 2.3.2 (for short positions) of Division F.1(c) of the Form;
 - (ii) report in item 2.3 of Division F.1(c) of the Form 8% of the higher of item 2.3.1 and 2.3.2 of Division F.1(c) of the Form as the floor for the comprehensive risk charge; and
 - (iii) report the applicable amount of the comprehensive risk charge for the correlation trading portfolio for the institution in item 2.4 of Division F.1(c) of the Form, which is the higher of item 2.2 and item 2.3.
133. A reporting institution must include the interest rate exposures subject to the incremental risk charge, and those subject to the comprehensive risk charge, in its calculation of VaR and stressed VaR.
134. A reporting institution must not offset its incremental risk charge against the comprehensive risk charge, or offset these two capital charges with other market risk capital charge applicable to the positions covered.
135. A reporting institution that is subject to the stress-testing requirements on correlation trading portfolio as set out in section 4(g) of Schedule 3 to the Rules is required under section 4(h) to conduct such stress tests at least weekly, and report its stress-testing results to the MA on a quarterly basis unless otherwise advised by the MA. Also, where the stress-testing results indicate a material shortfall of the comprehensive risk charge, the institution should report to the MA as soon as reasonably practicable in all the circumstances of the case. In this connection, the institution should -
- (a) submit its latest stress-testing results on its correlation trading portfolio, including comparisons with the comprehensive risk charge calculated using

the institution's internally-developed approach, to its usual supervisory contact for review upon submission of the quarterly CAR Returns, and in any case no later than 6 weeks after each quarter-end (unless otherwise advised by the MA); and

- (b) report to its usual supervisory contact any instances where the stress tests indicate a material shortfall of the comprehensive risk charge as soon as reasonably practicable in all the circumstances of the case. The HKMA would generally consider submission of such exception reports within 3 business days after the business day on which the AI's stress test has identified a material shortfall as a reasonable period.

- 136. If the MA is satisfied that the stress-testing results referred to in section 4(g) of Schedule 3 to the Rules indicate a material shortfall in the comprehensive risk charge of a reporting institution, the MA may impose a supplemental capital charge on the correlation trading portfolio, which should be reported in item 3 of Division F.1(c) of the Form.
- 137. A reporting institution should report in item 4 of Division F.1(c) of the Form (where applicable) the total market risk capital charge for specific risk calculated by internal models expressed as incremental risk charge or comprehensive risk charge, and the supplemental capital charge, as the sum of items 1.4, 2.4 and 3 of Division F.1(c) of the Form.

C.1.4. Division F.1(d) of Form MA(BS)3(IV) - Total market risk capital charge for specific risk under the IMM approach

- 138. A reporting institution should report in Division F.1(d) of the Form the total market risk capital charge for specific risk calculated by internal models under the IMM approach, which equals to the sum of items F.1(b)(3) and F.1(c)(4) of the Form.
- 139. If a reporting institution is not approved by the MA to use the IMM approach to model the VaR, stressed VaR, incremental risk charge and/or comprehensive risk charge, as the case may be, it should report the market risk capital charge for specific risk for debt securities, debt-related derivative contracts and credit derivative contracts in Division A of the Form and that for equities and equity-related derivative contracts in Division B of the Form.

C.1.5. Division F.1(e) of Form MA(BS)3(IV) - Total market risk capital charge under the IMM approach

- 140. Where a reporting institution uses more than one internal model to calculate the market risk capital charge for general market risk and the market risk capital charge for specific risk, the institution must comply with sections C.1.1, C.1.2 and C.1.3 of the instructions, as the case may be, except that it must apply the section(s) concerned separately to the relevant market risk capital charge generated from each model.

141. A reporting institution should report in Division F.1(e) of the Form its total market risk capital charge under the IMM approach, which is equal to the sum of items F.1(a)3 and F.1(d) of the Form.

C.2 Largest daily losses over the quarter

142. A reporting institution should report in Division F.2 of the Form in descending order (i) the five largest daily losses over the reporting quarter and (ii) their respective one-day VaR for the exposures calculated by the internal models. If the number of daily losses during the reporting quarter is less than five, only all of such daily losses should be reported.

Section D: Risk-weighted Amount for Market Risk

143. The total market risk capital charges calculated under the STM approach for each risk category should be extracted from Divisions A to E of the Form and reported in item 1 of Division G of the Form.
144. The total market risk capital charges calculated under the IMM approach should be extracted from Division F.1(e) of the Form and reported in item 2 of Division G of the Form.
145. The total risk-weighted amount for market risk of a reporting institution (i.e. item 3 of Division G of the Form) is equal to the sum of total market risk capital charge calculated under the STM approach (i.e. item 1 of Division G of the Form) and that calculated under the IMM approach (i.e. item 2 of Division G of the Form), multiplied by 12.5.

Hong Kong Monetary Authority
March 2018

Calculation of market risk capital charge for credit derivative contracts booked in reporting institutions' trading book

General

1. The calculation of market risk capital charge for credit derivative contracts (e.g. *total return swap*, *credit default swap* and credit-linked note) booked in a reporting institution's trading book is set out in this Annex, which should be read in conjunction with the completion instructions of this Return, CR-G-12 "Credit Derivatives" and Division 10 of Part 8 of the Rules. An authorized institution should use the notional amount of the credit derivative contract to calculate the market risk capital charge for its credit derivative contracts except for those that fall within paragraphs 19 and 20 of this Annex where the fair value of the credit-linked note should be used. A reporting institution should consult with the MA on the appropriate treatment of any credit derivative contracts it has entered into if the structure of, or the arrangement of, such contracts is not covered in this Annex.

STM Approach to the calculation of market risk

Specific risk

2. If a reporting institution has entered into a total return swap or a credit default swap as the protection seller, the institution should record a long position in the reference obligation specified in the swap contract.
3. If a reporting institution has entered into a total return swap or a credit default swap as the protection buyer, the institution should record a short position in the reference obligation specified in the swap contract.
4. If a reporting institution has purchased a credit-linked note (as the protection seller), the institution should record a long position in the reference obligation specified in the note and a long position in the note issuer.
5. If a reporting institution has issued a credit-linked note (as the protection buyer), the institution should record a short position in the reference obligation specified in the note.
6. Subject to paragraph 7, for the purposes of calculating the market risk capital charge for specific risk for n^{th} -to-default credit derivative contracts that fall within section 286(a)(iv) of the Rules, a reporting institution should -
 - (a) if the n^{th} -to-default credit derivative contract has an ECAI issue specific rating, apply section 287A(3A), (6) or (8) of the Rules, as the case may be, as if the contract were a securitization exposure in respect of positions in which the institution is the protection seller;

- (b) for other n^{th} -to-default credit derivative contracts, apply section 287 and Division 10 of the Rules.
- 7. For the purposes of paragraph 6:
 - (a) where a reporting institution has a position in one of the reference obligations underlying a first-to-default credit derivative contract and the contract hedges that position, the institution may offset with respect to the hedged amount (i) the market risk capital charge for specific risk for its position in the reference obligation; and (ii) that part of the market risk capital charge for specific risk for the credit derivative contract that relates to that particular reference obligation;
 - (b) where a reporting institution has multiple positions in the reference obligations underlying a first-to-default credit derivative contract, the offsetting of market risk capital charge specified in paragraph (a) above is allowed only for its positions in the underlying reference obligation having the lowest market risk capital charge for specific risk; and
 - (c) to avoid doubt, for the purposes of paragraphs (a) and (b) above, a reporting institution should-
 - (i) first offset the long and short positions in identical first-to-default credit derivative contracts before applying these two paragraphs as appropriate; and
 - (ii) not offset the market risk capital charge for specific risk for its position in any n^{th} -to-default credit derivative contract where n is greater than 1 with the market risk capital charge for its position in any underlying reference obligation.
- 8. If a reporting institution enters into a credit default swap, total return swap or credit-linked note which provides for payment to be made proportionately in respect of the reference obligations in the basket of reference obligations specified in the swap contract or note, as the case may be, the institution should record its positions in the reference obligations according to their respective proportions specified in the swap contract or note, as the case may be.
- 9. If a reporting institution has purchased or issued a credit-linked note which is referenced to multiple reference obligations and satisfies the conditions for a qualifying debt security or debt-related derivative contract set out in section B.1.1 of the completion instructions, the institution may:
 - (a) if it has purchased the note, record the specific risk arising from its long positions in the multiple reference obligations specified in the note as a single long position in the note;

- (b) if it has issued the note, record the specific risk arising from its short positions in the multiple reference obligations specified in the note as a single short position in the note.
- 10. Subject to paragraph 7, a reporting institution may use a credit derivative contract booked in the institution's trading book to offset the market risk capital charge for specific risk calculated for the institution's trading book position in-
 - (a) the underlying exposure in accordance with paragraph 11, 12 or 13 of this Annex; or
 - (b) another credit derivative contract in accordance with paragraph 11 (excluding subparagraph (b)), 12 or 13 (excluding subparagraph (a)) of this Annex with all necessary modifications.

If paragraph 11, 12 or 13 of this Annex does not permit a reporting institution to use a credit derivative contract booked in the institution's trading book to offset the market risk capital charge for specific risk calculated for the institution's trading book position in the underlying exposure or in another credit derivative contract, the institution should calculate and provide the market risk capital charge against both trading book positions.

11. A reporting institution may offset 100% of the market risk capital charge for specific risk for its position in a credit derivative contract against that for a position in the underlying exposure which is identical to the reference obligation specified in the contract if the values of the 2 positions, being the long or short position in the contract, and the short or long position respectively in the underlying exposure which is identical to the reference obligation specified in the contract, always move in the opposite direction and broadly to the same extent due to:
 - (a) the 2 positions consisting of identical exposures; or
 - (b) a long or short position in the underlying exposure being hedged by a total return swap and there being a match between the reference obligation specified in the total return swap and the position in the underlying exposure in every aspect, and notwithstanding that the maturity of the total return swap may be different from that of the position in the underlying exposure.

If a reporting institution offsets the market risk capital charge for specific risk for its positions pursuant to this paragraph, no market risk capital charge for specific risk is required to be calculated in respect of those positions.

12. A reporting institution may offset 80% of the market risk capital charge for specific risk for its position in a credit derivative contract against that for a position in the underlying exposure which is identical to the reference obligation specified in the contract where (i) the values of the 2 positions, being the long or short position in the contract, and the short or long position respectively in the underlying exposure which is identical to the reference obligation specified in the contract, always move in the opposite direction but not broadly to the same extent as set out in paragraph 11 of this Annex; and (ii) the institution demonstrates to the satisfaction of the MA that the

contract can mitigate the credit risk of the institution's position in the underlying exposure effectively. A reporting institution falls within this paragraph in any case where:

- (a) subject to paragraphs (b), (c) and (d), the institution's long or short position in the underlying exposure is effectively hedged by a credit default swap or a credit-linked note;
- (b) there is a match between:
 - (i) the reference obligation specified in the credit default swap or credit-linked note referred to in paragraph (a) and the position in the underlying exposure;
 - (ii) the maturity of the reference obligation specified in the credit default swap or credit-linked note referred to in paragraph (a) and of the swap contract or note, as the case may be; and
 - (iii) the currency in which the credit default swap or credit-linked note referred to in paragraph (a) and the position in the underlying exposure are denominated;
- (c) the **credit event** definitions and settlement mechanisms and other key factors of the credit default swap or credit-linked note referred to in paragraph (a) do not cause the price movement of the swap contract or note, as the case may be, to materially deviate from the price movement of the position in the underlying exposure; and
- (d) the credit default swap or credit-linked note referred to in paragraph (a) transfers risk effectively taking account of any restrictive payout provisions (including fixed payouts and materiality thresholds).

If a reporting institution offsets the market risk capital charge for specific risk for its positions pursuant to this paragraph, only 20% of the market risk capital charge for specific risk is required to be calculated for the position with the higher market risk capital charge for specific risk and the market risk capital charge for specific risk to be calculated for the other position shall be zero.

13. A reporting institution may offset partially the market risk capital charge for specific risk for its position in a credit derivative contract against that for a position in the underlying exposure where the values of the 2 positions, being the long or short position in the contract, and the short or long position respectively in the underlying exposure, usually move in the opposite direction in any case where:
- (a) the positions would fall within paragraph 11(b) of this Annex but for there being an asset mismatch between the reference obligation specified in the contract and the position in the underlying exposure (being that the reference obligation and the position in the underlying exposure are similar but not identical) and:

- (i) the reference obligation specified in the contract ranks for payment or repayment equally with, or junior to, the position in the underlying exposure; and
 - (ii) the obligor in respect of the position in the underlying exposure is the same legal entity as the obligor in respect of the reference obligation and legally enforceable cross default or cross acceleration clauses are included in the terms of the position in the underlying exposure and the reference obligation;
- (b) the positions would fall within paragraph 11(a) or 12 of this Annex but for there being a currency or maturity mismatch between the contract and the position in the underlying exposure (**currency mismatch** should be included in the calculation of market risk capital charge for foreign exchange exposures according to section B.3 of the completion instructions); or
- (c) the positions would fall within paragraph 12 of this Annex but for there being an asset mismatch between the reference obligation specified in the contract and the position in the underlying exposure (being that the reference obligation and the position in the underlying exposure are similar but not identical) and the position in the underlying exposure is included in one of the deliverable obligations specified in the contract.

If a reporting institution offsets the market risk capital charge for specific risk for its positions pursuant to this paragraph, 100% of the market risk capital charge for specific risk is required to be calculated for the position with the higher market risk capital charge for specific risk and the market risk capital charge for specific risk to be calculated for the other position is to be zero.

General market risk

14. If a reporting institution has entered into a total return swap as the protection seller, the institution should:
 - (a) record a long position in the reference obligation specified in the swap contract;
 - (b) if there are periodic interest payments under the swap contract, record a short position in a specific risk-free security with fixed or floating rate interest according to the payment terms of the swap contract.
15. If a reporting institution has entered into a total return swap as the protection buyer, the institution should:
 - (a) record a short position in the reference obligation specified in the swap contract;
 - (b) if there are periodic interest payments under the swap contract, record a long position in a specific risk-free security with fixed or floating rate interest according to the payment terms of the swap contract.

16. If a reporting institution has entered into a credit default swap with no periodic premiums or interest payments under the swap contract, the institution is not required to calculate or provide the market risk capital charge for general market risk for the swap contract.
17. If a reporting institution has entered into a credit default swap as the protection seller with periodic premiums or interest payments under the swap contract, the institution should record a long position in a specific risk-free security with fixed or floating rate interest according to the payment terms of the swap contract.
18. If a reporting institution has entered into a credit default swap as the protection buyer with periodic premiums or interest payments under the swap contract, the institution should record a short position in a specific risk-free security with fixed or floating rate interest according to the payment terms of the swap contract.
19. If a reporting institution has purchased a credit-linked note, the institution should record a long position in the note.
20. If a reporting institution has issued a credit-linked note, the institution should record a short position in the note.

IMM Approach to the calculation of market risk

21. Subject to paragraph 114 of Section C in the main text, a reporting institution should comply with section C of the completion instructions and the requirements specified in Schedule 3 to the Rules to apply the IMM approach to calculate the market risk capital charge for credit derivative contracts booked in its trading book.
22. A reporting institution which does not use the IMM approach to calculate the market risk capital charge for credit derivative contracts booked in its trading book should use the STM approach to calculate those capital charges.

Counterparty credit risk

23. If a reporting institution has entered into a total return swap as the protection buyer or the protection seller, the institution should calculate and provide the amount of capital required to cover the counterparty credit risk of its position in the swap contract.
24. If a reporting institution has entered into a credit default swap as the protection buyer, the institution should calculate and provide the amount of capital required to cover the counterparty credit risk of its positions in the swap contract.
25. If a reporting institution has entered into a credit default swap as the protection seller with no periodic premiums or interest payments under the swap contract, the institution is not required to calculate or provide any amount of capital required to cover the counterparty credit risk of its position in the swap contract.

26. If a reporting institution has entered into a credit default swap as the protection seller with periodic premiums or interest payments under the swap contract, the institution should calculate and provide the amount of capital required to cover the counterparty credit risk of its position in the swap contract.
27. There is no counterparty credit risk for a reporting institution as the purchaser or issuer of a credit-linked note.
28. A reporting institution must use the current exposure method or the IMM(CCR) approach to calculate its default risk exposures arising from credit derivative contracts booked in its trading book. Part III of the completion instructions of the Return of Capital Adequacy Ratio regarding counterparty credit risk should apply to credit derivative contracts booked in a reporting institution's trading book.
29. A reporting institution must calculate the *CVA capital charge* in respect of credit derivative contracts booked in its trading book in accordance with Part 6A of the Rules, the completion instructions for which are set out under Part IIIf of the Return of Capital Adequacy Ratio.

Foreign exchange risk

30. If a reporting institution using the STM approach to calculate its market risk has entered into a credit derivative contract denominated in a currency other than HKD, the institution should apply the calculation treatment set out in section B.3 of the completion instructions to its foreign exchange position in the contract.
31. If a reporting institution using the IMM approach to calculate its market risk has entered into a credit derivative contract denominated in a currency other than HKD, the institution should apply the calculation treatment set out in section C of the completion instructions to its foreign exchange position in the contract.

Illustrative examples for calculation of market risk capital charges under STM approach

Suppose as at 31 December 20XX, Example Bank Ltd. has the following positions in non-securitization interest rate exposures that (a) do not fall within a correlation trading portfolio, and (b) are also not nth-to-default credit derivative contracts:

1. a long position in US treasury bond (7.5% annual coupon) with face value equivalent to HKD78M and residual maturity of 8 years (fair value of the bond based on quoted price: HKD79,833K equivalent);
2. a long position in an unrated floating rate note (6.25% current annual coupon) issued by a US corporate with face value equivalent to HKD40M and next interest fixing date 9 months later (fair value of the note based on quoted price: HKD40,732K equivalent);
3. a long position in 10 futures contracts on 5-year US treasury note (face value USD100,000 per contract) for delivery 3 months later (selected deliverable: US treasury note (coupon 6.375%) maturing in 5.25 years, current price at 100.0625, conversion factor of 0.9423);
4. a single currency interest rate swap contract with face value HKD150M and residual maturity of 2.5 years (Example Bank Ltd receives annual floating rate interest and pays fixed rate interest at 8% per annum and the current floating rate is fixed at 5.5% with next interest fixing date 6 months later);
5. a long position in 50 futures contracts in 3-month HIBOR interest rate (face value HKD1M per contract) for delivery 6 months later;
6. a nine against fifteen forward rate agreement sold on 6-month HIBOR with notional amount HKD20M and settlement date 9 months later;
7. a GBP2M 2-year cap written on GBP 6-month LIBOR at cap rate 8%, next interest fixing date 6 months later and residual maturity 2 years (i.e. the cap is written on the reporting date);
8. a long position in forward foreign exchange contract of EUR5M against HKD25M equivalent maturing in 3 months;
9. a long position in 100,000 shares of a US listed company with current market price at HKD110 equivalent;
10. a long position in 50,000 shares of a HK listed company hedged by a long position in 25 put option contracts (each contract represents 1,000 shares) for the same equity (the current market price for the equity is HKD30 and the exercise price of all the option contracts is HKD33);

11. a short position in 1 Hang Seng Index futures contract for delivery 3 months later, current Hang Seng index at 10,000;
12. entered into a 5-year credit default swap as the protection seller (i.e. credit risk buyer) on HKD10M nominal of a non-qualifying Bond Y with a credit quality grade 4. The protection buyer pays it a fee of 100 basis points at the beginning and there are no periodic premiums or interest payments during the life of the swap. Under the terms of the contract, if a credit event occurs on Bond Y, it will pay the protection buyer HKD10M;
13. issued HKD1M nominal of a 3-year credit-linked note referenced to a non-qualifying Bond K with a credit quality grade 5. The note pays 8% interest annually. Under the terms of the contract, if no credit event occurs on Bond K, the note will mature at par in three years. If a credit event occurs on Bond K, the note will be redeemed for the credit event payment which is also set at HKD1M.

Positions to be reported in the Form:

1. Report the fair value of a long position in Division A.1(a), item 1.1 and Division A.2, USD ladder, >7 to 10 years time band.
2. Report the fair value of a long position in Division A.1(a), item 1.13 and Division A.2, USD ladder, >6 to 12 months time band.
3. Report a long position in the selected treasury note in Division A.1(a), item 1.1 and Division A.2, USD ladder, >5 to 7 years time band. Report the same amount for a short position in a zero-coupon specific risk-free security in Division A.2, USD ladder, >1 to 3 month time band.

Assume spot exchange rate is 7.8,

Amount to be reported: $\text{USD}100,000 \times 10 \times 100.0625\% / 0.9423 = \text{USD}1,061,896 = \text{HKD}8,283\text{K}$ equivalent

4. Report the fixed rate leg as a short position in a 2.5-year bond in Division A.2, HKD ladder, >2 to 3 years time band. Report the floating rate leg as a long position in a 6-month zero-coupon specific risk-free security in Division A.2, HKD ladder, >3 to 6 months time band.

Assume the HKD zero-coupon yields are as follows:

<u>Period</u>	<u>Zero-coupon yields</u>
1M	5.31%
3M	5.63%
6M	5.81%
1Y	6.16%
2Y	6.69%
3Y	7.07%

(Zero-coupon yields within one year can be taken as cash rates i.e. HIBOR; zero-coupon yields beyond one year can be constructed from, say, swap rates.)

Cash flows of the two legs of the HKD swap contract:

Pay: fixed rate interest
8% of HKD150M in 6 months
8% of HKD150M in 18 months
108% of HKD150M in 30 months

Receive: floating rate interest
105.5% of 150M in 6 months

Zero-coupon (ZC) rates at 18 months can be obtained from the linear interpolation between the one-year and two-year zero-coupon rates.

$$\text{ZC}(18 \text{ months}) = (6.16\% + 6.69\%) / 2 = 6.425\%$$

Similarly,

$$\text{ZC}(30 \text{ months}) = (6.69\% + 7.07\%) / 2 = 6.88\%$$

PV of the fixed leg (i.e. pay side)

$$\begin{aligned} &= \text{HKD}150\text{M} \times \left(\frac{0.08}{(1 + 0.0581 \times 0.5)} + \frac{0.08}{(1 + 0.06425)^{1.5}} + \frac{1.08}{(1 + 0.0688)^{2.5}} \right) \\ &= \text{HKD}159,766\text{K} \end{aligned}$$

PV of the floating leg (i.e. receive side)

$$\begin{aligned} &= \text{HKD}150\text{M} \times \frac{1.055}{(1 + 0.0581 \times 0.5)} \\ &= \text{HKD}153,783\text{K} \end{aligned}$$

5. Report a long position in a 9-month zero-coupon specific risk-free security in Division A.2, HKD ladder, >6 to 12 months time band and a short position in a 6-month zero-coupon specific risk-free security in Division A.2, HKD ladder, >3 to 6 months time band.

Similar to the approach in example 4,
 $\text{ZC}(9 \text{ months}) = (5.81\% + 6.16\%) / 2 = 5.985\%$

Amounts to be reported:

$$\begin{aligned} \text{Long position} &= \text{HKD}50\text{M} / (1 + 0.05985 \times 0.75) \\ &= \text{HKD}50\text{M} \times 0.957 \\ &= \text{HKD}47,852\text{K} \end{aligned}$$

$$\begin{aligned} \text{Short position} &= \text{HKD}50\text{M} / (1 + 0.0581 \times 0.5) \\ &= \text{HKD}50\text{M} \times 0.9718 \end{aligned}$$

$$= \text{HKD}48,589\text{K}$$

6. Report a long position in a 15-month zero-coupon specific risk-free security in Division A.2, HKD ladder, >1.0 to 1.9 years time band and a short position in a 9-month zero-coupon specific risk-free security in Division A.2, HKD ladder, >6 to 12 months time band.

Similar to the approach in example 4,

$$\text{ZC}(15 \text{ months}) = 6.16\% + (6.69\% - 6.16\%) \times 0.25 = 6.2925\%$$

$$\begin{aligned} \text{Long position} &= \text{HKD}20\text{M} / (1 + 0.062925)^{1.25} \\ &= \text{HKD}18,531\text{K} \end{aligned}$$

$$\begin{aligned} \text{Short position} &= \text{HKD}20\text{M} / (1 + 0.05985 \times 0.75) \\ &= \text{HKD}19,141\text{K} \end{aligned}$$

7. Report the cap as 3 written call option contracts on 6-month forward rate agreement i.e. 6 against 12, 12 against 18 and 18 against 24.

(The rate for the first 6 months is already set on the reporting date i.e. the option contract already expires.)

Assume the delta of the option contracts are:

6 against 12	0.055
12 against 18	0.17
18 against 24	0.225

Assume the discounting factors are:

6 month	0.9674
12 month	0.9346
18 month	0.9009
24 month	0.8673

Assume spot exchange rate is 12,

Report in Division A.2, GBP ladder:

For the first option contract -

$$\begin{aligned} &\text{a long position in the } >6 \text{ to } 12 \text{ months time band} \\ &= \text{GBP}2\text{M} \times 0.055 \times 0.9346 \\ &= \text{HKD}1,234\text{K equivalent} \end{aligned}$$

$$\begin{aligned} &\text{a short position in the } >3 \text{ to } 6 \text{ months time band} \\ &= \text{GBP}2\text{M} \times 0.055 \times 0.9674 \\ &= \text{HKD}1,277\text{K equivalent} \end{aligned}$$

For the second option contract -

a long position in the >1.0 to 1.9 years time band
= $\text{GBP}2\text{M} \times 0.17 \times 0.9009$
= HKD3,676K equivalent

a short position in the >6 to 12 months time band
= $\text{GBP}2\text{M} \times 0.17 \times 0.9346$
= HKD3,813K equivalent

For the third option contract -

a long position in the >1.9 to 2.8 years time band
= $\text{GBP}2\text{M} \times 0.225 \times 0.8673$
= HKD4,683K equivalent

a short position in the >1.0 to 1.9 years time band
= $\text{GBP}2\text{M} \times 0.225 \times 0.9009$
= HKD4,865K equivalent

(For simplicity, reporting required in Division E.2 of the Form is not presented in this example.)

8. Report a long position in a 3-month zero-coupon specific risk-free security in Division A.2, EUR ladder, >1 to 3 months time band and a short position in a 3-month zero-coupon specific risk-free security, HKD ladder, >1 to 3 months time band.

Assume 3-month EUR cash rate is 3.25% and spot exchange rate is 10,

Long position = $\text{EUR}5\text{M} / (1 + 0.0325 \times 0.25)$
= HKD49,597K equivalent

Short position = $\text{HKD}25\text{M} / (1 + 0.0563 \times 0.25)$
= HKD24,653K

(For simplicity, reporting required in Division C of the Form is not presented in this example.)

9. Report a long position of $\text{HKD}110 \times 100,000 = \text{HKD}11\text{M}$ in Division B, item 1, US column.
10. Report a long position of $\text{HKD}30 \times 25,000 = \text{HKD}750\text{K}$ in Division B, item 1, HK column.

Report 25,000 shares covered by put option contract in Division E.1(a), item 1.3.

Amount to be reported:

= $(25,000 \times \text{HKD}30 \times 16\%) - [25,000 \times \text{HKD}(33 - 30)]$
= HKD45K

11. Report HKD50 x 10,000 = HKD500K in Division B, item 5, HK column and report the same amount in Division A.2, HKD ladder, >1 to 3 months time band.
12. Report a long position of HKD10M in Division A.1(a), item 1.11. No reporting is required in Division A.2.
13. Report a short position of HKD1M in Division A.1(a), item 1.12 and a short position in a 3-year note in Division A.2, HKD ladder, >2 to 3 years time band.

Using the zero-coupon yields in example 4,

Value of the note to be reported in Division A.2

$$\begin{aligned}
 &= \text{HKD1M} \times \left(\frac{0.08}{(1 + 0.0616)} + \frac{0.08}{(1 + 0.0669)^2} + \frac{1.08}{(1 + 0.0707)^3} \right) \\
 &= \text{HKD1,026K}
 \end{aligned}$$

Numerical illustration of the composition of the market risk capital charge for general market risk for interest rate exposures

1. Bank A has the following positions:
 - (a) a long position in a qualifying bond, \$13.33 million fair value, residual maturity 8 years, coupon rate 8%;
 - (b) a long position in a sovereign bond, \$75 million fair value, residual maturity 2 months, coupon rate 7%;
 - (c) for an interest rate swap contract, \$150 million¹, Bank A receives floating rate interest and pays fixed rate interest, next interest fixing date 9 months later, residual life of swap contract 8 years; and
 - (d) a long position in an interest rate futures contract, \$50 million, delivery date 6 months later, life of the underlying exposure 3.5 years.
2. The table below shows how these positions are slotted into the time bands and are weighted according to the risk-weights given in **Table 2** of section B.2. After weighting the positions, the next steps in the calculation will be:

(\$ million)	Zone 1				Zone 2			Zone 3					
Time band (coupon of not less than 3%)	0-1	>1-3	>3-6	>6-12	>1-2	>2-3	>3-4	>4-5	>5-7	>7-10	>10-15	>15-20	>20
	Months				Years								
Position		+75 Sov.	-50 Fut.	+150 Swap			+50 Fut.			-150 Swap +13.33 Qual.			
Risk-weight (%)	0.00	0.20	0.40	0.70	1.25	1.75	2.25	2.75	3.25	3.75	4.50	5.25	6.00
Position x Weight		+0.15	-0.20	+1.05			+1.125			-5.625 +0.5			
Vertical Disallow.										0.5 x 10% = 0.05			
Horizontal Disallow. 1	0.20 x 40 % = 0.08												
Horizontal Disallow. 2					1.125 x 40% = 0.45								
Horizontal Disallow. 3	1.0 x 100% = 1.0												

- (a) The *vertical disallowance* in time band >7-10 years has to be calculated: The matched position in this time band is \$0.5 million (being the lesser of the absolute values of the total risk-weighted long and short positions) which leads to a market risk capital charge of \$0.05 million (i.e. 10% of \$0.5 million) or \$50,000. The remaining net risk-weighted (short) position is -5.125.

¹ The positions should be recorded based on the fair value of the underlying exposure. Depending on the current interest rate, the fair value of each leg of the swap contract (i.e., the 8-year bond and the 9-month floater) can be either higher or lower than the notional amount. For the sake of simplicity, the illustration assumes that the current interest rate is identical with the one the swap contract is based on.

- (b) The *horizontal disallowance for individual zones* has to be calculated: As there is more than one position in zone 1 only, a horizontal disallowance can be calculated in this zone. In doing this, the matched position is calculated as \$0.2 million (being the lesser of the absolute values of the total net risk-weighted long and short positions for the zone). The market risk capital charge for the horizontal disallowance in zone 1 is \$0.08 million (i.e. 40% of \$0.2 million) or \$80,000. The remaining net risk-weighted (long) position in zone 1 is +\$1.00 million.
- (c) The *horizontal disallowances between adjacent zones*² have to be calculated: After calculating the net risk-weighted position in zone 1, the following risk-weighted positions remain: zone 1 +\$1.00 million, zone 2 +\$1.125 million, zone 3 -\$5.125 million. The matched position between zone 2 and zone 3 is \$1.125 million (being one zone having a total net risk-weighted long position while another zone has a total net risk-weighted short position). The market risk capital charge in this case is \$0.45 million (i.e. 40% of \$1.125 million) or \$450,000.
- (d) The *horizontal disallowance between zone 1 and zone 3* has to be calculated: The net risk-weighted (long) position in zone 1 is +\$1.00 million, and the net risk-weighted (short) position in zone 3 is -\$4.00 million, resulting in a remaining net risk-weighted position of \$3.00 million (regardless of sign). The horizontal disallowance between the zone 1 and zone 3 is 100% of the matched position which leads to a market risk capital charge of \$1.00 million (i.e. 100% of \$1.00 million) or \$1,000,000.
- (e) The remaining net risk-weighted position is \$3.00 million leading to a market risk capital charge of \$3,000,000.

3. The total market risk capital charge for general market risk in this illustration is:

• for the vertical disallowance	\$50,000
• for the horizontal disallowance in zone 1	\$80,000
• for the horizontal disallowance between adjacent zones	\$450,000
• for the horizontal disallowance between zone 1 and zone 3	\$1,000,000
• for the remaining net risk-weighted position	<u>\$3,000,000</u>
	\$4,580,000

² No horizontal disallowance between zone 1 and zone 2 needs to be calculated as their positions are of the same sign.

Completion Instructions

Return of Capital Adequacy Ratio Part V - Risk-weighted Amount for Operational Risk Form MA(BS)3(V)

Introduction

1. Form MA(BS)3(V) should be completed by each authorized institution incorporated in Hong Kong to calculate ***operational risk***, based on the approach to calculation as specified by or agreed with the Monetary Authority (MA) under Part 9 of the Banking (Capital) Rules. Reporting institutions should use the ***basic indicator approach (BIA approach)*** to calculate their ***risk-weighted amount for operational risk***, unless they have the prior approval of the MA to use the ***standardized (operational risk) approach (STO approach)***, ***alternative standardized approach (ASA approach)*** or other methods. Where an institution has been approved to use a calculation method other than the BIA approach, STO approach or ASA approach, it should report its risk-weighted amount for operational risk in a manner as agreed with the MA.
2. This Form and its completion instructions should be read in conjunction with the Rules and relevant supervisory policy/guidance on the revised capital adequacy framework.

Section A: Definitions and Clarification

3. Under the BIA approach, STO approach or ASA approach, the reporting institution's risk-weighted amount for operational risk is calculated based on its average ***gross income*** or loans and advances of the ***last 3 years***. If an institution has been in operation for 18 months or more but less than 3 ***years***, it should treat any partial year of operation of 6 months or more as a full year, and any partial year of operation of less than 6 months as zero for the purposes of calculating the last 3 years arithmetic mean of its gross income and/or loans and advances in the ***standardized business lines*** of retail banking and commercial banking¹.
4. If any partial year is counted as a full year, the gross income of that partial year should be annualized and taken as the gross income of that year. As for the applicable loans and advances under the ASA approach, the arithmetic mean of the amount of loans and advances outstanding at the end of each full ***calendar quarter*** within that partial year should be taken as the loans and advances for that year. If any partial year is treated as zero, the gross income and loans advances in the standardized business lines of retail banking and commercial banking for that partial year should be taken as zero.

¹ Please refer to sections 324 and 325 of the Rules for the meaning of "loans and advances in the standardized business line of commercial banking" and "loans and advances in the standardized business line of retail banking".

5. An illustration of calculating the gross income and loans and advances in the standardized business lines of retail banking and commercial banking for partial and full year of operation is shown at **Annex V-A**.
6. Examples on reporting of operational risk under different approaches are shown at **Annex V-B**.

Section B: Calculation and Reporting of Risk-weighted Amount

7. The following paragraphs explain how to report the gross income/loans and advances, *capital charges* and risk-weighted amount under the BIA approach, STO approach or ASA approach.

B.1 BIA Approach

8. The capital charge for operational risk under the BIA approach should be calculated using the following formula:

$$K_{BIA} = [\sum(GI_{1...n} \times \alpha)] / n$$

Where:

K_{BIA} = capital charge for operational risk calculated under the BIA approach;

GI = gross income, where positive, of the last 3 years;

α = 15%; and

n = number of the last 3 years for which gross income is positive.

Any gross income for a year that is negative or zero should be excluded from both the numerator (GI) and the denominator (n) of the above formula.

9. Reporting institutions using the BIA approach should report items 1, 4 and 5 of this Form.

Item

Nature of item

1. Report the gross income and capital charges for each of the last 3 years ending on the reporting *calendar quarter end date*.

(a) Gross income for the last 3 years is calculated by:

- **First year**: aggregating the gross income recognized by the institution in the calendar quarter ending on the reporting calendar quarter end date and in each of the 3 immediately preceding calendar quarters;
- **Second year**: aggregating the gross income recognized by the institution in the year immediately preceding the first year; and

- **Third year**: aggregating the gross income recognized by the institution in the year immediately preceding the second year.

(b) Capital charge is calculated by multiplying the gross income in each of the first year, second year and third year, where positive, (as calculated under (a) above) by a capital charge factor of 15%.

4. **Capital charge for operational risk**

This is calculated by aggregating the capital charges for the last 3 years (as reported under item 1) and obtaining the arithmetic mean of the aggregate capital charge by dividing that aggregate figure by the number of the last 3 years in which the gross income is positive.

5. **Risk-weighted amount for operational risk**

This is calculated by multiplying the capital charge for operational risk under the BIA approach (as reported under item 4) by 12.5.

B.2 **STO Approach**

10. The capital charge for operational risk under the STO approach should be calculated using the following formula²:

$$K_{STO} = \{ \sum_{\text{years 1-3}} \max [\sum(GI_{1-8} \times \beta_{1-8}), 0] \} / 3$$

Where:

K_{STO} = capital charge for operational risk calculated under the STO approach;

GI_{1-8} = gross income for each of the standardized business lines for each of the last 3 years; and

β_{1-8} = capital charge factor applicable to each of the standardized business lines (as set out in the instructions for items 2.1a to 2.1h under paragraph 11).

11. Reporting institutions using the STO approach should report items 2, 4 and 5 of this Form.

<u>Item</u>	<u>Nature of item</u>
2.1a to 2.1h	Report the gross income and capital charges for each of the 8 standardized business lines (under items a to h) for each of the last 3 years ending on the reporting calendar quarter end date.

² If the reporting institution has business activities that could not be mapped into any of the 8 standardized business lines and are reported under the unclassified business line, the gross income of these activities should also be included in the above formula in calculating the capital charge for operational risk. See instructions under item 2.1i for details.

- (a) Gross income for each of the 8 standardized business lines for the last 3 years is calculated by:
- First year: aggregating the gross income recognized by the institution in respect of each of the 8 standardized business lines in the calendar quarter ending on the reporting calendar quarter end date and the gross income recognized by the institution in respect of each of the 8 standardized business lines in each of the 3 immediately preceding calendar quarters;
 - Second year: aggregating the gross income recognized by the institution in respect of each of the 8 standardized business lines in the year immediately preceding the first year; and
 - Third year: aggregating the gross income recognized by the institution in respect of each of the 8 standardized business lines in the year immediately preceding the second year.
- (b) The capital charge for each of the 8 standardized business lines is calculated by multiplying the gross income of each standardized business line in each of the first year, second year and third year (as calculated under (a) above) by the capital charge factor applicable to that standardized business line set out below:

<u>Standardized business line</u>	<u>Capital charge factor</u>
Corporate finance	18%
Trading and sales	18%
Retail banking	12%
Commercial banking	15%
Payment and settlement	18%
Agency services	15%
Asset management	12%
Retail brokerage	12%

2.1i If none of the mapping principles set out in sections 2(c)(i), (ii) and (iii) of Schedule 4 of the Rules enables the reporting institution to map gross income in respect of a particular business activity into a particular standardized business line, the institution can map it under the unclassified business line.

Report the gross income of the unclassified business line for the last 3 years using the same method as set out in (a) above. The capital charge is calculated by multiplying the gross income of this business line in each of the first year, second year and third year by a capital charge factor of 18%.

- 2.2 Report the total capital charges for each of the last 3 years by adding together the capital charges calculated under items 2.1a to 2.1h and 2.1i above for each of the last 3 years. In any given year of the last 3 years, the reporting institution may offset a positive capital charge for any standardized or the unclassified business line in the given year with a negative capital charge for any other standardized or the unclassified business line in that given year. However, it shall not offset positive or negative capital charges for the standardized or the unclassified business line between any of the last 3 years.

4. **Capital charge for operational risk**

This is calculated by aggregating the capital charges for the last 3 years (as reported under item 2.2) and obtaining the arithmetic mean of the aggregate capital charge by dividing that aggregate figure by 3. If the aggregate capital charge for all the standardized and the unclassified business lines in any given year is negative, it should be assigned a zero value and that given year should still be counted in the denominator when calculating the last 3 years arithmetic mean.

5. **Risk-weighted amount for operational risk**

This is calculated by multiplying the capital charge for operational risk under the STO approach (as reported under item 4) by 12.5.

B.3 ASA Approach

12. The methodology to calculate the capital charge under the ASA approach is the same as the STO approach except for 2 standardized business lines – retail banking and commercial banking. For these 2 standardized business lines, loans and advances, when multiplied by a fixed factor of 0.035, replace gross income in calculating the capital charge for operational risk.
13. The capital charge for operational risk in the standardized business line of retail (or commercial) banking for each year should be calculated using the following formula:

$$K_{RB} = LA_{RB} \times 0.035 \times \beta_{RB}$$

Where:

K_{RB} = capital charge for the standardized business line of retail (or commercial) banking;

LA_{RB} = loans and advances in the standardized business line of retail (or commercial) banking for each year; and

β_{RB} = capital charge factor for the standardized business line of retail (or commercial) banking.

14. Reporting institutions using the ASA approach should report items 3, 4 and 5 of this Form. In reporting item 3, the reporting institution can report either item 3.1 or 3.3 and item 3.2 or 3.4, depending on whether the institution wishes to treat its

standardized business lines of retail banking and commercial banking as 2 separate business lines or one business line and the remaining 6 standardized and the unclassified business lines as separate business lines or one business line. Once the reporting institution has chosen the reporting methodology it should not change that reporting methodology unless it has the prior approval of the MA.

<u>Item</u>	<u>Nature of item</u>
<i>3.1a and 3.1b</i>	<p>Report the loans and advances and capital charges for the standardized business lines of retail banking and commercial banking for each of the last 3 years ending on the reporting calendar quarter end date.</p> <p>(a) The loans and advances in the standardized business lines of retail (or commercial) banking for the last 3 years is calculated by:</p> <ul style="list-style-type: none"> • <u>First year</u>: taking the arithmetic mean of the amount of loans and advances as at the reporting calendar quarter end date and as at each of the 3 immediately preceding calendar quarter end dates; • <u>Second year</u>: taking the arithmetic mean of the amount of loans and advances as at each of the 4 calendar quarter end dates immediately preceding the first year; and • <u>Third year</u>: taking the arithmetic mean of the amount of loans and advances as at each of the 4 calendar quarter end dates immediately preceding the second year. <p>(b) The capital charge for the standardized business line of retail (or commercial) banking is calculated by multiplying the loans and advances of the business line in each of the first year, second year and third year (as calculated under (a) above) by 0.035 and then by a capital charge factor of 12% (or 15%).</p>
<i>3.1c</i>	Report the subtotal of capital charges for the standardized business lines of retail banking and commercial banking for each of the last 3 years by adding together the capital charges reported under items <i>3.1a</i> and <i>3.1b</i> for each of the last 3 years.
<i>3.2a to 3.2f</i>	Report the gross income and capital charge for each of the 6 standardized business lines (under items <i>a</i> to <i>f</i>) for each of the last 3 years ending on the reporting calendar quarter end date, using the same method as that for the STO approach (as set out in the instructions for items <i>2.1a</i> to <i>2.1h</i> under paragraph 11).
<i>3.2g</i>	Report the gross income and capital charge for the unclassified business line using the same method as that for the STO approach (as set out in the instructions for item <i>2.1i</i> under paragraph 11).

- 3.2h Report the subtotal of the capital charges for the 6 standardized and the unclassified business lines under items 3.2a to 3.2g for each of the last 3 years. The reporting institution may, in any given year of the last 3 years, offset a positive capital charge for any of these standardized or the unclassified business line in the given year with a negative capital charge for any other standardized or the unclassified business line in the given year. However, it shall not offset positive or negative capital charges for the standardized or the unclassified business line between any of the last 3 years.
- 3.3 Treat the standardized business lines of retail banking and commercial banking as one business line and report the loans and advances and capital charges for these business lines in one lump sum for each of the last 3 years ending on the reporting calendar quarter end date.
- (a) The aggregate loans and advances in the standardized business lines of retail banking and commercial banking for the last 3 years are calculated using the same method as set out for items 3.1a and 3.1b above.
 - (b) The aggregate capital charge for the standardized business lines of retail banking and commercial banking is calculated by multiplying the loans and advances of these 2 business lines in each year (as calculated under (a) above) by 0.035 and then by a capital charge factor of 15%.
- 3.4 Treat the 6 standardized and the unclassified business lines (as referred to under items 3.2a to 3.2g) as one business line and report the gross income and capital charge for these business lines in one lump sum for each of the last 3 years ending on the reporting calendar quarter end date.
- (a) The aggregate gross income for the 6 standardized and the unclassified business lines is calculated by using the same method as set out for items 3.2a to 3.2f and 3.2g above.
 - (b) The aggregate capital charge for the 6 standardized and the unclassified business lines is calculated by multiplying the aggregate gross income of these business lines in each year (as calculated under (a) above) by a capital charge factor of 18%.
- 3.5 Report the total capital charges for each of the last 3 years by adding together the capital charges for the standardized business lines of retail banking and commercial banking (item 3.1c or 3.3) and the capital charges for the remaining 6 standardized and the unclassified business lines (item 3.2h or 3.4) for each of the last 3 years. If the aggregate capital charge for the remaining 6 standardized and the unclassified business lines in a given year of the last 3 years is

negative, it should be assigned a zero value and should not be used to offset the capital charges for the standardized business lines of retail banking and/or commercial banking.

4. **Capital charge for operational risk**

This is calculated by aggregating the capital charges for the last 3 years (as reported under item 3.5) and obtaining the arithmetic mean of the aggregate capital charge by dividing that aggregate figure by 3.

5. **Risk-weighted amount for operational risk**

This is calculated by multiplying the capital charge for operational risk under the ASA approach (as reported under item 4) by 12.5.

Hong Kong Monetary Authority
March 2007

An illustration of calculating the gross income and loans and advances in the standardized business lines of retail banking and commercial banking for partial and full year of operation

REPORTING POSITION: 31 MARCH 2007

Proxy for operational risk exposures	First Year	Second Year	Third Year	Number of years in operation
Reporting institution in operation for 3 years or more				
Gross income	sum of gross income for the quarters ended on 31.03.07, 31.12.06, 30.09.06 and 30.06.06	sum of gross income for the quarters ended on 31.03.06, 31.12.05, 30.09.05 and 30.06.05	sum of gross income for the quarters ended on 31.03.05, 31.12.04, 30.09.04 and 30.06.04	3
Loans and advances in the standardized business line of retail/commercial banking	arithmetic mean of the amount outstanding as at 31.03.07, 31.12.06, 30.09.06 and 30.06.06	arithmetic mean of the amount outstanding as at 31.03.06, 31.12.05, 30.09.05 and 30.06.05	arithmetic mean of the amount outstanding as at 31.03.05, 31.12.04, 30.09.04 and 30.06.04	3
Reporting institution in operation for 2½ years or more but less than 3 years				
Gross income	same as above	same as above	annualize the gross income of the partial year	3
Loans and advances in the standardized business line of retail/commercial banking	same as above	same as above	<u>≥ 6 months but < 9 months</u> arithmetic mean of the amount outstanding as at 31.03.05 and 31.12.04 <u>≥ 9 months but < 12 months</u> arithmetic mean of the amount outstanding as at 31.03.05, 31.12.04 and 30.09.04	3
Reporting institution in operation for 2 years or more but less than 2½ years				
Gross income	same as above	same as above	zero	2
Loans and advances in the standardized business line of retail/commercial banking	same as above	same as above	zero	2
Reporting institution in operation for 1½ years or more but less than 2 years				
Gross income	same as above	annualize the gross income of the partial year	N.A. (Reporting institution not yet in operation)	2
Loans and advances in the standardized business line of retail/commercial banking	same as above	<u>≥ 6 months but < 9 months</u> arithmetic mean of the amount outstanding as at 31.03.06 and 31.12.05 <u>≥ 9 months but < 12 months</u> arithmetic mean of the amount outstanding as at 31.03.06, 31.12.05 and 30.09.05	N.A. (Reporting institution not yet in operation)	2

Examples on reporting of operational risk under different approaches

Reporting institution's gross income and loans and advances for the last 3 years as at 31 March 2007

Business lines	First Year	Second Year	Third Year
	HK\$'000	HK\$'000	HK\$'000
Gross income (Note 1)			
1. Corporate finance	1,500	1,200	-500
2. Trading and sales	1,000	900	300
3. Retail banking	1,200	1,000	-1,000
4. Commercial banking	2,000	1,300	700
5. Payment and settlement	900	-500	-1,300
6. Agency services	1,100	-200	500
7. Asset management	700	500	100
8. Retail brokerage	300	600	200
Total	8,700	4,800	-1,000
Loans and advances (Note 2)			
1. Retail banking	25,000	15,000	10,000
2. Commercial banking	14,000	18,000	20,000
Total	39,000	33,000	30,000
Note 1 - Gross income of the first year = sum of gross income for Q1/07, Q4/06, Q3/06 & Q2/06 Gross income of the second year = sum of gross income for Q1/06, Q4/05, Q3/05 & Q2/05 Gross income of the third year = sum of gross income for Q1/05, Q4/04, Q3/04 & Q2/04 Note 2 - Loans and advances of the first year = arithmetic mean of the amount outstanding as at Q1/07, Q4/06, Q3/06 & Q2/06 Loans and advances of the second year = arithmetic mean of the amount outstanding as at Q1/06, Q4/05, Q3/05 & Q2/05 Loans and advances of the third year = arithmetic mean of the amount outstanding as at Q1/05, Q4/04, Q3/04 & Q2/04
